I estimate the limbs in the westerly aspect to be reduced are approximately 12-15m from trunk to tips. The proposed reduction of 3.5m will leave a residual length of 9-12m

The tree is currently about 21 m high and will be reduced by 4.5m to a height of 16m, where there is a naturally forming secondary lower canopy which will form the new top of the tree...

Best wishes,

Rich
