Aerial photo showing the location of the trees,

In the circles above is a selection of conifers which the client would like to remove completely to allow for the planting of new semi mature and mature trees with a higher amenity value. There has been some extensive work carried out on the property with a new landscaping design which is be installed around the house. Removal of these trees would allow the landscaping plan to extend out into the wider garden around the house to help it blend in more naturally with the landscape and would also have the benefit of adding some more interesting and tree species enhancing the area for all.

Photo 1 – this shows the 2 trees which are marked in Yellow and Purple in the aerial photo.

Photo 2 – This photo shows the tree marked in Light Blue

Photo 3 – this photo shows the tree marked with a green circle. As you can see it is growing right against a Sequoia. It would be beneficial to remove this thuja to allow the sequoia to mature without competition and disturbing the natural form.

Photo 4 – this photo shows the tree marked in orange on the aerial photo. This tree is located along the main drive of the house.

Below is a selection of photos showing the rectangular area marked on the aerial photo above.

The photos above show a range of shrubs and small trees within the rectangular section, they are ilex aquifolium and Sorbus aucuparia. They have all grown in close proximity and are all of veery low amenity value. My client would like to remove them all to allow for new planting of trees and shrubs with higher amenity value. It would also expose a lovely mature scots pine and young Taxus baccata, We have already been in contact with the Tunbridge Wells commons team and they have given us position to cut back any overhanging trees which have low amenity value which are on the commons land to help improve the area.
