DETAILED INFORMATION ON TREES 13. 14, 15 & 16.

Tree 13 Sycamore

In June of this year (2023) a large branch fell to the ground whilst I was working in the garden. I estimate it weighed 100lbs + *(doc. 7)*. There is a similar branch in a similar position which needs removing as well as three other smaller branches. (See photo 7)

Tree 14 Lime

I calculate this tree is in the region of 30m high. At present it has a large number of dead branches and one dead trunk. I have replaced 1 ridge tile, 2 tile and half tiles, and about 15 straight tiles in the last six years. The trunk is 4 ½ metres away from the house and the prevailing southwest wind blows any bits from the tree directly on to the roof of the house. I believe that the tree needs a substantial reduction in height and a trim of the east facing branch.

Tree 15 Holm Oak

This tree I calculate to be about 28m high. It is also 4 ½ metres away from the house and needs some reduction in height as well as 2 – 3 metres removing from the east facing side and the removal of all of the dead branches.

Tree 16 Sycamore

This tree is about the same height as the Lime and needs the branches at the top removing or the two most easterly trunks removed.
