DC/25/1016 - Surgery to 1x Yew (7 Farriers Court) REVISED

Starting height and spread of the tree

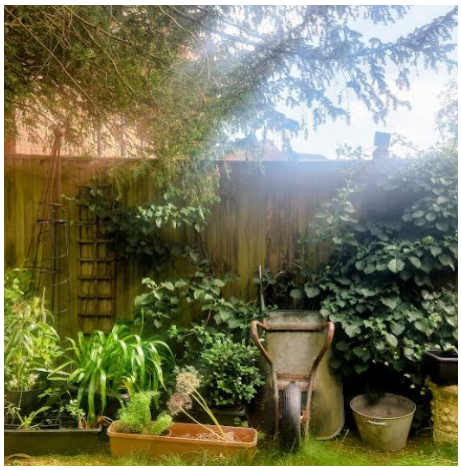

Height of crown 10.2m
Spread from trunk base, measured 0.3m above ground level, as the base is surrounded by staging,:-
N: 4m
W: 5.5m
S: 5.5m and is in contact with the wall of the Smith & Gadd building in The Courtyard, also spreading over the roof.
E: 8m overhanging into Horsham Park and the trunk with an eastwards lean of 20°.(please see photo that follows). Discussion is needed to identify just how much of this mostly dead timber outside our boundary could usefully be removed.

Lifting the crown

The height of the crown above ground level is 1.5m to the lowest foliage (please see photo below).

It would be reasonable to lift the crown to 3m above ground level.

← Lift crown to 3m above ground level

← Lowest foliage 1.5m above ground level

← Ground level

This would involve removing the upper of the two interfering limbs in the photo that follows; this upper

limb later bends under the lower one and bears the lowest foliage.

Detail from above: Cross-over of the two limbs
