

Lighting Assessment – Proposed Bodywise Sign

This lighting assessment relates to the proposed freestanding double-sided sign for Bodywise Boutique Wellness, positioned alongside the existing low brick boundary wall. The proposed illumination is intentionally minimal, subtle and architectural in nature, designed to complement the conservation-style character of the area and avoid excessive visual impact.

Assessment Item	Proposed Specification
Type of illumination	Low-level external solar-powered uplighting
Lighting style	Static warm white architectural accent lighting
Illumination source	Discrete solar spike uplights positioned at base of sign
Colour temperature	Approx. 2700K warm white
Illuminance / luminance	Approx. 50 cd/m ² (low-level illumination only)
Lighting behaviour	Static – no flashing, moving or intermittent lighting
Purpose	Business identification and subtle evening visibility only
Light spill	Minimal due to low-output narrow beam fittings directed solely at sign surface
Visual impact	Designed to remain understated and appropriate within surrounding streetscape

The proposed lighting is not intended to function as bright advertisement illumination. The objective is to provide only a soft ambient glow to enhance visibility and complement the architectural appearance of the sign during evening hours. The sign is non-digital, non-moving and intended solely for business identification and wayfinding purposes.
