Albury S.I. Limited has prepared this Report with reasonable skill and care for the sole use of the Client in accordance with the terms and conditions of the contract under which our services were provided. No duty of care and no contractual obligation (whether expressed or implied) is owed to any third party. Should any third party rely on this Report then they do so at their own risk and Albury S.I. Limited shall have no liability whether in contract or in tort, in negligence, for breach of statutory duty or otherwise to any such party. No warranty, expressed or implied, is made as to the professional advice included in this Report or any services provided by Albury S.I. Limited.

This Report is prepared for the specific purpose stated and in relation to the development proposals or usage indicated to Albury S.I. Limited at the time of preparation. The recommendations should not be used for adjacent schemes and may not be appropriate for alternative proposals.

The recommendations made and opinions expressed in this Report are based on the strata conditions revealed by the fieldworks as indicated on the exploratory records, together with an assessment of the data from in situ and laboratory tests. No liability can be accepted for conditions which have not been revealed by the fieldworks, for example, between exploratory positions. While this Report may offer opinions on the possible configuration of strata, both between the excavations and below the maximum depth achieved by the investigation, these comments are for guidance only and no liability can be accepted for their accuracy. The data obtained relate to the conditions which are relevant at the time of the investigation.

The groundwater observations entered on exploratory records are those noted at the time of the investigation. The normal rate of progress does not usually permit the recording of any equilibrium water level for any one water strike. It should be noted that groundwater levels are prone to seasonal variation and to changes in local drainage conditions. The word 'none' indicates that groundwater was sealed off by the borehole casing or that no water was observed in the exploratory hole upon completion.

APPENDICES

- 1 Envirocheck Data

1 INTRODUCTION

1.1 Objectives

The Desk Study comprises a review of the readily available geological, historical and environmental sources for information about the site, together with a walkover survey of the area. This includes the commissioning of an Envirocheck report supplied by Landmark Information Group. This report presents the findings of the Desk Study together with an outline Conceptual Site Model and preliminary risk assessment, based upon identified potential sources of contamination which may pose a significant risk to receptors or end-users of the site.

In preparing this report reference has been made to relevant guidance, which includes the 'Investigation of potentially contaminated sites. Code of Practice.' (BSI, 2011) and the Land Contamination: risk management (LCRM) guidance (2020).

1.2 Proposed Development

The client proposes to apply for a change of use for the existing building from agricultural to residential usage to provide 4 houses at Swains Farm, Brighton Road, Henfield ("the site").

2 THE SITE

2.1 Site Location

The site covers an area of 800m² and is located at Ordnance Survey National grid reference 522390, 115700. The site appears to be occupied by an existing barn. There are residential properties to the east and north-east, with a public footpath present on the eastern boundary.

2.2 Site Topography

There are no levels near the site to provide an accurate topographic level for the site. The levels within Brighton Road to the south are indicated as 28m. The footpath leading to the site from Brighton Road initially appears to slope downwards, and then proceeds to slope upwards again towards the site. OS mapping contours indicate the site as being between the 25m and 20m contours rising to the north east to 37.2mOD 250m from the site.

3 SITE HISTORY

3.1 Historical Mapping

The historical Ordnance Survey mapping contained within the Envirocheck report has been reviewed. The maps reviewed are included in Appendix 1.

Table 1 - Historical Mapping Summary			
Date	Source Scale	Relevant Information	
		On Site	Off Site
1839	Tithe Maps	The site forms part of plot 336, which is listed as High Field which is classed as arable land.	There are structures to the east and north-east of the site. A pond is present to the immediate south-east and surface water course within 100m south. The remainder of plot 336 bounds the southern, western, and northern boundaries.
1875	1:2500	The site is comprised of undeveloped land.	Henfield Common is present 15m to the south. Swains Farm is present 25m to the north-east. There is a well 190m to the south of the site. There is a sand pit 315m to the north-west. Surface water course to the south and east indicated to flow north.
1879	1:10,560	No significant change.	No significant change.
1897	1:2500	There is a small structure in the south-eastern corner of the site.	There is a structure on the eastern boundary of the site. There is a well 50m to the north-east. The sand pit has expanded and is now situated 275m to the north-west.
1899	1:10,560	No significant change.	No significant change.
1910	1:2500	No significant change.	Structures have been constructed within 10m to the north-east of the site. The well to the south is no longer present.
1911	1:10,560	No significant change.	No significant change.
1951	1:10,560	The small structure on-site is no longer present.	There is an additional pond on the southern boundary.
1956	1:2500	No significant change.	Carnation Nurseries is present 150m to the north-west. There is an unidentified tank 180m to the west/north-west associated with the nursery, as well as an unidentified tank 180m to the north-west.
1963	1:10,560	No significant change.	No significant change.

1974	1:2500	There is a structure now present in the east of the site.	The nursery and associated tank are no longer present. Structures have been constructed within 20m to the east.
1985	1:2500	No significant change.	No significant change.
1994	1:2500	No significant change.	No significant change.
2000	1:10,000	The structure has been replaced or extended and now occupies the entirety of the site.	No significant change.
2006	1:10,000	No significant change.	No significant change.
2024	1:10,000	No significant change.	No significant change.

At the time of the earliest mapping the site formed part of arable/undeveloped land. A small structure first appeared on-site c.1897 and subsequently demolished c.1951. Further developments on-site occurred c.1974 and c.2000. The site appears to have remained for agricultural use.

3.2 Aerial Imagery

Consideration of the modern aerial imagery contained within Google Earth and Google Maps have been summarised in the table below.

Table 2 - Modern Aerials Summary		
Date	Relevant Information	
	On Site	Off Site
1947	The structure on-site in the 1911 mapping from the previous section does not appear to be present.	There is arable land to the north, east and west, with Henfield Common present to the south. There is a structure to the north.
1999-2023	The site is comprised of a structure.	There appears to be residential units to the east, with agricultural structures to the north and north-east. The north and west remain agricultural, but there are developments 100m to the west.

3.3 Planning Database Review

A review of the historical planning records stored on the Horsham District website has been carried out. The current planning application for the removal of existing agricultural building to be replaced with 4No. new buildings comprising 4No. residential dwellings was submitted in 2024. Prior approval and prior notification applications for this work was submitted in 2019 and 2022, respectively, and both were permitted. No further planning applications were found for this site.

3.4 Bomb Damage Maps

According to Zetica UXO, the site is deemed as being at a low risk of aerial delivered UXO being present, hence, a specialist UXO risk assessment is not thought to be necessary for this site.

4 GEOLOGY

4.1 Published Geology

An examination of the 1:50,000 British Geological Map, sheet no. 318, reveals that the majority of the site is underlain by Head Deposits of Quaternary age. These superficial deposits are underlain by the Folkestone Formation of Cretaceous age, which also outcrop at surface at the northern edge of the site.

4.2 Historical Borehole Records

The records of the BGS have been reviewed and borehole TQ21NW9/A is situated 220m to the west. The borehole records indicate that sands belonging to the Folkestone Formation were encountered beneath the surface, and continued to a depth of 4.90m. At this depth, the Sandgate Formation was revealed and proven to the concluding depth of the borehole at 37m. No groundwater observations were noted within the record, however, the borehole yield was recorded as nil, suggesting that the borehole was dry upon completion.

Based upon these the anticipated ground conditions beneath the site are summarised in tabular form below. It should be noted that the borehole above was situated in an area without Head Deposits present.

Table 3 - Anticipated Ground Conditions		
Strata	Thickness m	Depth to Base m
Made Ground	TBC by SI	TBC by SI
Head Deposits	TBC by SI	TBC by SI
Folkestone Formation	4.9	4.9
Sandgate Formation	32.1+	37+

4.3 Hydrogeology

The site is underlain by a superficial Secondary (A) or Minor aquifer of medium vulnerability associated with the underlying Head Deposits. The Folkestone Formation at depth is classed as

a principal aquifer of high vulnerability. However, the site is not underlain by a drinking water Source Protection Zone [SPZ].

The nearest groundwater abstraction is at Mill Field, The Common, 515m to the south-west, for agricultural spray irrigation.

4.4 Radon

The Envirocheck report indicates that the site is in a lower probability radon affected area as less than 1% of properties are above the action level. Moreover, no protective measures as described in BRE report BR211 are necessary in the construction of new properties or extensions.

5 ENVIRONMENTAL SETTING

5.1 Hydrology & Flood Risk

There is a stream 53m to the south-east of the site, but there is no flood risk from this feature. However, there is potential for flooding at surface from the underlying groundwater table.

5.2 Landfill Data

There is a historical landfill site listed in the Envirocheck report 769m to the south-east. This site was active between 1987 and 1988 for the disposal of inert material. In addition, there is also a landfill site listed as Kentons Farm situated 929m to the south of the site, however no further information is given about this site. A search through the Environment Agency records indicates that this site is the same site as the one listed as active between 1987 and 1988. Given the distance from the site neither are credible risks of ground gas to the proposed development.

According to the Envirocheck report, there is potentially infilled land 276m to the north-west inferred from 1974 OS mapping. The risk of ground gas from this feature, identified on historical mapping as a sand pit, is considered to be low due to the age of the potential source and that it does not appear to have been infilled.

5.3 Recent & Current Land Use

The site has historically been used for agricultural use. The nearest petrol filling station is situated 877m to the west. No other industrial trades are listed in the vicinity of relevance.

6 SITE RECONNAISSANCE

A visit to site was made on 22nd July 2024 using the procedures outlined in CLR 2. At the time of the survey the conditions were dry and overcast.

The site is covered by hard standing; the existing barn comprises 'Atcost' steel and concrete portal framed open structure which occupies the entire boundary of the site. The structure has cement sheet profile roof and exterior cladding, which probably contains chrysotile asbestos (ACM). There was an empty cylindrical tank within the barn, of unknown use, however it was likely a water tank or grain silo. The barn is currently used to store bags of potatoes.

Access to the site was openly accessible from a public footpath connected to Brighton Road to the south of the site. The northern boundary was used to store pallets and other waste material. Vegetation bounded the north, east and south, with residential properties adjacent to the east. The pond on the southern boundary was noted to be dry during the visit.

During the visit a number of photographs were taken. A plan showing the existing site layout is presented as Figure 1 and the proposed layout is shown in Figure 2. The photographs taken during the site reconnaissance are presented as Figure 3 attached to this report.

7 PRELIMINARY RISK ASSESSMENT

7.1 Conceptual Site Model

In accordance with current LCRM guidance, a Conceptual Site Model has been prepared for this site. The model prepared for the site in tabular format below lists potential sources of contamination, identified receptors on and within the immediate vicinity of the site, together with the pathways between them. A pathway must exist for an identified source to pose a risk to a receptor, thereby forming an active pollutant linkage. The primary receptors are considered to be future residents (human health), surrounding ecology (plants and animals), controlled waters and proposed buildings.

A qualitative assessment of the risk of each potential pollutant linkage is given based upon the CIRIA guidance document 'Contaminated Land Risk Assessment: A Guide to Good Practice' (Rudland, Lancefield and Mayell, 2001). The risk is a combination of the probability or frequency of occurrence of a defined hazard and the magnitude of the consequences of the occurrence.

Table 4 - Preliminary Conceptual Site Model

Source(s)	Potential Pathway(s)	Receptor(s)	Risk Level
Former landfill site and infilled land (off-site) - <i>ground gases: carbon dioxide and methane.</i>	Migration, ingress and accumulation	Proposed buildings	Negligible/very low
Potential ACM within the fabric of the existing structures, roof sheeting and cladding - <i>Asbestos</i>	Inhalation of dust	Site workers and neighbours	Low to moderate
Historical use for agriculture (on-site) - <i>Heavy metals</i> - <i>PAH</i> - <i>Petroleum hydrocarbons (potential fuel storage)</i> - <i>Diesel Range)</i>	Dermal contact, inhalation and ingestion	Site workers and end users	Moderate
	Leaching	Potential water supply pipe Groundwater (Secondary & Principal Aquifer) Surface water pond and water course	Moderate

Any existing ACM cladding and roofing profile cement sheets should be disposed of in accordance with current legislation and best practice, by a licensed waste carrier.

The site has had historical agricultural use. Whilst no obvious sources of contamination were apparent at the time of the visit, there is likely to have been some impact of the near surface soils. Therefore, any intrusive investigation should ascertain the thickness of made ground and target areas of proposed gardens where pollutant linkages are likely to be active. The proposed scope of testing should include for typical priority contaminants, which includes heavy metals, PAH and screening for asbestos containing materials (ACM).

There is potential for storage of pesticides and herbicides. However, organic herbicides and/or pesticides have comparatively short half-lives and, whilst the persistence of certain herbicides can vary and depends upon the conditions, any residual contamination will have

dispersed within 5-10 years. Therefore, specific testing for organic herbicides or pesticides is not considered necessary.

The existing structures are evidently clad in ACM and will need to be carefully removed, with disposal in accordance with current guidance and best practice.

7.2 Groundwater

The anticipated groundwater flow within the superficial aquifer is thought to be influenced by topography and towards the watercourse which is present to the east and flows north. There is may be some hydraulic continuity between the superficial aquifer and adjacent surface water feature pond.

7.3 Geotechnical Hazards

There are no significant ground stability hazards identified within the Envirocheck report.

7.4 Conclusions & Recommendations

A number of potential sources of contamination have been identified on and in within the immediate vicinity of the site which may pose a risk to the proposed development. Hence, an intrusive ground investigation should be carried out to assess the identified risks. This work could be combined with a geotechnical investigation in order to provide suitable parameters to enable foundation design.

The proposed scope of investigation should be agreed with the Local Authority Contaminated Land Officer and, if necessary, the warranty provider in order to ensure that it meets with their approval.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice

Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment

A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant

A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

A selection of organisations who provide data within this report:

Envirocheck reports are compiled from 136 different sources of data.

Published 1879

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Historical Aerial Photography

Published 1947 - 1951

Source map scale - 1:10,560

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

Sussex

Published 1951

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

10k Raster Mapping

Published 2000

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2024

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Supply of Unpublished Survey Information

Published 1974

Source map scale - 1:2,500

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a 'work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Additional SIMs

Published 1985

Source map scale - 1:2,500

The SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1994

Source map scale - 1:2,500

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.
