

Horsham District Council
Habitats Regulations Assessment Appropriate Assessment Record

Plan/project: DC/26/0366|Outline planning application, with all matters reserved (except for primary access to the highway) for a phased development comprising: the demolition of existing buildings and the construction of up to 1,000 residential dwellings (including affordable housing) (Use Class C3); up to 80 specialist accommodation units (Use Class C2); a mixed-use neighbourhood centre (Use Classes E and F); education facilities (Use Class F1(a)); business and employment floorspace (Use Classes B2, B8 and E(g)); redevelopment of existing agricultural buildings including construction of a building for community use (Use Classes E and F2); improvements to public rights of way; sports pitches; gypsy and traveller pitches/plots; public open space; landscaping, and associated infrastructure | Land North West of Southwater

The purpose of this HRA record is to assess the need for appropriate assessment in relation to the plan/project detailed above.

The Conservation of Habitats and Species Regulations 2017 (as amended) requires that a Habitats Regulations Assessment screening is carried out in relation to any plan or project which is likely to have a significant effect on Habitats (European) sites, either alone or in combination with other plans or projects. European sites are Special Protection Areas and Special Areas of Conservation. Ramsar sites should also be given the same level of protection, as stated within the National Planning Policy Framework.

In line with the Court judgement (CJEU *People Over Wind v Coillte Teoranta* C-323/17), mitigation measures cannot be taken into account when carrying out a screening assessment to decide whether a development is likely to result in significant effects on a Habitats site. **This report is therefore an Appropriate Assessment under the Conservation of Habitats and Species Regulations 2017 (as amended).**

Where an Appropriate Assessment is carried out a project may only be authorised after having ascertained that it will not adversely affect the integrity of the site(s) concerned.

Table 1: Screening matrix

Stage 1 HRA screening	
Brief description of the Plan/Project	Application: DC/26/0366 Planning Application: Outline planning application, with all matters reserved (except for primary access to the highway) for a phased development comprising: the demolition of existing buildings and the construction of up to 1,000 residential dwellings (including affordable housing) (Use Class C3); up to 80 specialist accommodation units (Use Class C2); a mixed-use neighbourhood centre (Use Classes E and F); education facilities (Use Class F1(a)); business and employment floorspace (Use Classes B2, B8 and E(g)); redevelopment of existing agricultural buildings including construction of a building for community use (Use Classes E and F2); improvements to public rights of way; sports pitches; gypsy and traveller pitches/plots; public open space; landscaping, and associated infrastructure Location: Land North West of Southwater
Brief description of the Habitats sites within scope of this assessment	The Mens SAC (Sussex bat SAC), The Ebernoe Common SAC lie within West Sussex and the Impact Risk Zones identified by Natural England includes Horsham District. The Mens Special Area of Conservation (SAC) is located approximately 11.2km west of the site and lists Barbastelle bats as a qualifying feature. A long and varied history of management has seen The Mens move from an open, wood pasture system with huge, spreading parkland trees and pollards to a high forest with closely spaced trees with narrow crowns. A lack of management in recent years has added to this silvicultural diversity.

	Ebernoe Common SAC is located approximately 16.1km to the west of the site and lists Barbastelle and Bechstein's bats as qualifying features. Ebernoe Common is dominated by old wood pasture where Commoners would have turned out their cattle or pigs to graze and browse on young trees and scrub, beech mast and acorns, or on the grassy meadows in glades and clearings. Grazing stopped by the middle of the 20th century and the wood pasture became more and more overgrown. Great effort has been put into opening up glades and rides and restoring grazing to this SAC. Arun Valley SAC, SPA and Ramsar is approximately 12.7km to the southwest and lists rare and diverse plant, invertebrate and bird assemblages as qualifying features. It consists of low-lying grazing marsh, largely on alluvial soils, but with an area of peat derived from a relict raised bog. Variation in soils and water supply lead to a wide range of ecological conditions and hence a rich flora and fauna.
Qualifying Features for SPA/SAC	The Mens SAC <u>Annex I habitats that are a primary reason for selection of the site:</u> 9120 Atlantic acidophilous beech forests with <i>Ilex</i> and sometimes also <i>Taxus</i> in the shrub layer (<i>Quercion robori-petraeae</i> or <i>Ilici-Fagenion</i>) The Mens is an extensive area of mature Beech <i>Fagus sylvatica</i> woodland rich in lichens, bryophytes, fungi and saproxylic invertebrates, and is one of the largest tracts of Atlantic acidophilous beech forests in the south-eastern part of the habitat's UK range. It is developing a near-natural high forest structure, in response to only limited silvicultural intervention over the 20th century, combined with the effects of natural events such as the 1987 great storm. <u>Annex II species present as a qualifying feature, but not a primary reason for site selection:</u> 1308 Barbastelle <i>Barbastella barbastellus</i> Ebernoe Common SAC <u>Annex I habitats that are a primary reason for selection of this site</u> 9120 Atlantic acidophilous Beech forests with <i>Ilex</i> and sometimes also <i>Taxus</i> in the shrub layer (<i>Quercion robori-petraeae</i> or <i>Ilici-Fagenion</i>). Ebernoe Common has an extensive block of Beech high forest and former wood-pasture over dense Holly <i>Ilex aquifolium</i>, and has a very rich epiphytic lichen flora, including <i>Agonimia octospora</i> and <i>Catillaria atropurpurea</i>. It represents Atlantic acidophilous Beech forests in the south-eastern part of the habitat's UK range. The Beech woodland is associated with other woodland types, open glades and pools, which contribute to a high overall diversity. The woods are important for a number of bat species, in particular 1323 Bechstein's bat <i>Myotis bechsteinii</i> and 1308 Barbastelle. <u>Annex II species that are a primary reason for selection of this site:</u> 1308 Barbastelle <i>Barbastella barbastellus</i> A maternity colony of Barbastelles utilises a range of tree roosts in this area of 91A0 old sessile Oak woods with <i>Ilex</i> and <i>Blechnum</i> in the British Isles, which has a dense understorey of holly as well as open glades and open water. Maternity roost sites are usually in dead tree stumps, but the species appears to be present throughout the year, with individuals utilising a range of roost sites in tree holes and under bark.

	1323 Bechstein's bat <i>Myotis bechsteinii</i> A maternity colony of Bechstein's bat is associated with this area of 91A0 Old sessile Oak woods with <i>Ilex</i> and <i>Blechnum</i> in the British Isles. Roosts are mainly in old woodpecker holes in the stems of live mature oak <i>Quercus petraea</i> trees. Arun Valley SPA A037 Bewick's swan, <i>Cygnus columbianus bewickii</i> (non-breeding). During the time of site notification, the SPA supported 115 individuals representing at least 1.6% of the wintering population in Great Britain (5 year peak mean 1992/93 - 1996/97). During the non-breeding season, the SPA regularly supports an assemblage of waterfowl with the area regularly supporting 27,241 individual waterfowl (5 year peak mean for 1992/93 to 1996/97) including: Shoveler <i>Anas clypeata</i>, Teal <i>Anas crecca</i>, Wigeon <i>Anas penelope</i>, Bewick's Swan <i>Cygnus columbianus bewickii</i>. Arun Valley SAC 4056 Little Whirlpool Ramshorn snail <i>Anisus vorticulus</i> <i>Anisus vorticulus</i> occurs across a range of sites in southern and eastern England. The Arun valley is one of the three main population centres for this species in the UK. This proposed site includes two of its core sites in the wash lands of the Arun floodplain (Pulborough Brooks and Amberley Wild Brooks SSSIs).
Qualifying Features for Ramsar	Arun Valley Ramsar Ramsar criterion 2 The site holds seven wetland invertebrate species listed in the British Red Data Book as threatened. One of these, <i>Pseudamnicola confusa</i>, is considered to be endangered. The site also supports four nationally rare and four nationally scarce plant species Ramsar criterion 3 In addition to the Red Data Book invertebrate and plant species, the ditches intersecting the site have a particularly diverse and rich flora. All five British duckweed (<i>Lemna</i> species), all five water-cress (<i>Rorippa</i> species), and all three British water milfoils (<i>Myriophyllum</i> species), all but one of the seven British water dropworts (<i>Oenanthe</i> species), and two-thirds of the British pondweeds (<i>Potamogeton</i> species) can be found on site. Ramsar criterion 5 Assemblages of international importance: Species with peak counts in winter: 13774 waterfowl (5 year peak mean 1998/99-2002/2003).
Conservation Status of the relevant Qualifying Features	The Mens SAC The Barbastelle is one of the UK's rarest mammals. Few maternity roost sites are known in the UK. While the SAC series makes a contribution to securing favourable conservation status for this Annex II species, wider measures are also necessary to support its conservation in the UK These are outlined in the Species Biodiversity Action Plan (DEFRA website). <i>It is likely that its low population density and slow population growth make it particularly vulnerable to:</i> • further loss and fragmentation of ancient deciduous woodland habitat; • loss, destruction and disturbance of roosts in buildings, trees and underground sites; • a reduction in numbers of insect prey due to habitat simplification acting through factors such as fertiliser use and intensive grazing.

	Ebernoe Common SAC Barbastelle as outlined for The Mens SAC. Bechstein's Bat Species Biodiversity Action Plan (DEFRA website): <i>The rarity of this species means that it is poorly understood, but according to the national species action plan, its low population density, exacting habitat requirements and low rates of reproduction make it particularly vulnerable to factors such as:</i> • <i>Further loss and fragmentation of open ancient deciduous woodland habitat.</i> • <i>Loss, destruction and disturbance of roosts or potential roosts (particularly in old trees).</i> Arun Valley SAC, SPA and Ramsar In line with the national trend, the number of Bewick's swans wintering in the Arun Valley has declined since the time of designation and is now typically fewer than 50 birds. This may reflect an overall decline in the population of the species and/or be due to the effects of a milder climate in which more are able to winter in continental Europe (The Birds of Sussex, 2014). The waterfowl assemblage numbers fluctuate depending upon conditions in the valley but over the past five years have averaged 40,311, an increase from the five year mean of 27,241 at the time of designation. The Arun Valley is one of the remaining strongholds for the Little Whirlpool Ramshorn Snail.
Conservation Objectives (Only Relevant for SPA/SAC)	The Mens SAC Ensure that the integrity of the site is maintained or restored as appropriate, and ensure that the site contributes to achieving the Favourable Conservation Status of its Qualifying Features, by maintaining or restoring; • The extent and distribution of qualifying natural habitats and habitats of qualifying species • The structure and function (including typical species) of qualifying natural habitats • The structure and function of the habitats of qualifying species • The supporting processes on which qualifying natural habitats and the habitats of qualifying species rely • The populations of qualifying species, and, • The distribution of qualifying species within the site. Ebernoe Common SAC Ensure that the integrity of the site is maintained or restored as appropriate, and ensure that the site contributes to achieving the Favourable Conservation Status of its Qualifying Features, by maintaining or restoring; • The extent and distribution of qualifying natural habitats and habitats of qualifying species • The structure and function (including typical species) of qualifying natural habitats • The structure and function of the habitats of qualifying species • The supporting processes on which qualifying natural habitats and the habitats of qualifying species rely • The populations of qualifying species, and, • The distribution of qualifying species within the site. Arun Valley SAC & SPA Ensure that the integrity of the site is maintained or restored as appropriate, and ensure that the site contributes to achieving the aims of the Wild Birds Directive, by maintaining or restoring; • The extent and distribution of the habitats of the qualifying features

	• The structure and function of the habitats of the qualifying features • The supporting processes on which the habitats of the qualifying features rely • The population of each of the qualifying features, and, • The distribution of the qualifying features within the site.
Key vulnerabilities / factors affecting site integrity	Issues listed in the relevant Site Improvement Plan (SIP) are: The Mens SAC • Forestry and woodland management; • Habitat connectivity for barbastelle bats; • Invasive species; • Changes in land management, with reference to foraging and commuting routes; • Air pollution, risk of atmospheric nitrogen deposition; • Public access / disturbance, with regards to light levels. The mechanism for addressing these issues within the SIP is investigation, research and monitoring; with the exception of appropriate management, and removal of, rhododendron, within The Mens SAC. Ebernoe Common SAC • Forestry and woodland management; • Off-site habitat availability / management; • Habitat fragmentation; • Change in land management, with reference to foraging and commuting routes for Barbastelles; • Hydrological changes; • Air pollution, risk of atmospheric nitrogen deposition; • Public access / disturbance, with regards to light levels. Again, the mechanism for addressing all of these issues within the SIP is investigation, research, monitoring at this stage. Arun Valley SAC and SPA • Inappropriate water levels • Water pollution • Inappropriate ditch management • Disturbance
Assessment Criteria	
The individual elements of the project (either alone or in combination with other plans or projects) likely to give rise to impacts on the Habitats site	There is one record for Barbastelle bat within 2km of the site, approximately 1.5km northwest from 2014 (Sussex Biodiversity Record Centre (SxBRC). Additionally, there are no European Protected Species Mitigation Licences have been granted for this species within 2km of the site (Sussex Biodiversity Record Centre – accessed under licence) and MAGIC maps https://magic.defra.gov.uk/MagicMap.aspx). The Bat Survey Report (hda, August 2026) recorded low levels of Barbastelle activity using the site. The Sussex Bat Special Area of Conservation Planning and Landscape Scale Enhancement Protocol provides advice for developers and local Councils when assessing applications which fall within an identified 12 km Impact Zone for The Men's SAC, Ebernoe Common SAC. In line with this Protocol, this application is located within the wider Conservation Area of The Mens SAC and significant impacts or severance to flightlines need to be considered. This development does not occur along one of the identified flightlines. From the submitted documents, it appears that the site comprises large areas of modified grassland, lowland mixed deciduous woodland, mixed

scrub, ponds and hedgerows. The Technical Note Appendix B 2026 Bat Survey Report (Hankinson Duckett Associates, June 2026) states the plan is to retain and enhance existing hedgerows and treelines for foraging and commuting bats, to create new wetland habitats and to implement a long-term management strategy to maintain high-quality habitats, particularly as the rare Barbastelle bat has been recorded on site. The proposals do require the removal of trees assessed as PRF-I and PRF-M.

Based on the threats listed in the SIPs, the following potential impact pathways are considered with reference to the development proposals regarding the need for further assessment:

Direct land take - The proposed development will not result in any direct land take from any designated sites. Direct land take does not therefore have the potential to result in likely significant effects (LSE) and can be screened out and will not be considered further.

Forestry and woodland management - This threat / issue is of relevance to the habitats within the designated sites themselves. There is no pathway for woodland management at these locations to be affected by the proposals. There is no potential for forestry and woodland management to be impacted by the proposals, so they have been screened out and will not be considered further.

Habitat connectivity and availability for foraging and commuting Barbastelle bats (functionally linked land)

Barbastelle bats are qualifying features for both SACs, and threats and issues relating to this species in the wider area have been identified in the relevant SIPs as:

- Off-site habitat availability / management;
- Habitat fragmentation / Habitat connectivity for barbastelle bats;
- Changes in land management, with reference to foraging and commuting routes.

The proposed development is within the 12km wider conservation area of The Mens SAC as set out in the Sussex Bat SAC planning and landscape scale enhancement protocol. It is therefore possible that bats from The Mens SAC use habitat within the site for foraging and/or commuting and all impacts need to be assessed.

As there is potential for habitat fragmentation from lighting or loss of functionally linked land for Barbastelle bats as part of the proposal and therefore, this has been screened in and will need to be considered further at Stage 2 Appropriate Assessment.

The proposed development is also within the 12km wider conservation area of Ebernoe Common SAC as set out in the Sussex Bat SAC planning and landscape scale enhancement protocol. Therefore, Bechstein's bats are considered likely to be absent, and as such, screened out, and they will not be considered further.

Invasive species

This threat concerns invasive rhododendron within The Mens SAC, and, as such there is no pathway for impacts due to the proposals. There is no potential for invasive species contained within in the proposals which would impact upon The Mens SAC, so they have been screened out and will not be considered further.

Hydrological changes

This threat / issue is of no relevance to The Mens SAC and Ebernoe Common SAC.

Air pollution

	The proposal will result in an increase in local residents and use of the SACs and Arun Valley SPA, and Ramsar are currently above their critical load for nitrogen deposition as noted in the HRA Screening Statement for Petworth Neighbourhood Development Plan (South Downs National Park Authority, 2017). Natural England Advice to Local Authorities when Considering Air Quality Impacts at HRA poses that air pollution impacts are predominately considered within 200m of a road. As the development is >200m from any Habitats site, the potential for LSE on the Habitats sites due to air pollution can be <u>screened out</u> and will not be considered further. Public access / disturbance, with regards to light levels. The HRA Screening Statement for Petworth Neighbourhood Development Plan (South Downs National Park Authority, 2017) notes that most visits to the Mens and Ebernoe Common SACs take place during daylight, with low levels of recreation at night. As such, they conclude that significant adverse effects due to lighting are unlikely. Recreation itself (i.e. during daylight hours) is not listed as threat within the SIPs. There is no potential for disturbance effects on Barbastelle bats associated with increased lighting from the development. This impact pathway therefore needs to be <u>screened out</u>. We believe that there will therefore be no Likely Significant Effect on the Sussex bat SACs from the development alone. In combination effects As there is potential for LSE from habitat connectivity for commuting bats, the potential for the development proposals to contribute to any likely significant effects, in combination with other plans and projects will be assessed at Stage 2 Appropriate Assessment.
Test 1 the significant test:	The Technical Note Appendix B 2026 Bat Survey Report (Hankinson Duckett Associates, June 2026) and Hankinson Duckett Associates, January 2026)) recommends the implementation of bat sensitive lighting. External lighting would result in the loss of foraging and commuting habitat from lighting introduced to the residential development. There is evidence to suggest that Barbastelle bats use these for linear foraging and commuting routes within the Impact Risk Zone of the SACs. The LPA therefore considers that, without mitigation, it is not possible to conclude no 'likely significant effect' (LSE) to The Mens SAC in terms of Habitat connectivity and availability for foraging and commuting Barbastelle bats when considered from the development alone. In addition, the removal of multiple trees with bat roost potential could have an impact on the site as a roost resource in-combination with other plans and projects is also a possible pathway for LSE so this will be assessed further in Stage 2: Appropriate Assessment. Therefore, there is a need for this assessment to proceed to HRA Stage 2: Appropriate Assessment for impacts on designated features (Barbastelle bats). Therefore, in accordance with the Sussex Bat SAC planning and landscape scale enhancement protocol, this assessment needs to proceed to HRA Stage 2: Appropriate Assessment. This will consider, with mitigation, the impacts of fragmentation of commuting routes for Barbastelle bats on the above designated sites, either alone or in combination with other plans and projects. After mitigation has been embedded into the project design, Test 2 – the integrity test then needs to be applied.

Stage 2 Appropriate Assessment

The above Stage 1 HRA screening has determined that LSE are possible at The Men's SAC as a result of impacts on habitat connectivity and availability for foraging and commuting Barbastelle bats. These pathways have been screened in, and the potential for adverse effects on site integrity, either alone, or in-combination will be assessed.

Therefore, this section of the report to inform HRA Stage 2 only discusses the potential for impacts to commuting and foraging Barbastelle as a result of the proposed development.

Potential for Adverse Effects on the Integrity (AEOI) of a Habitats site from the development alone.

Barbastelle have been found to commute in low numbers along the treelines and hedgerows onsite so the site is considered important for Barbastelle bats at a site level which lies within the bat sustenance zone of a bat SAC designated for this Appendix II species.

Based on published data¹ Natural England recommends that the Impact Risk Zone of 12.0km (as detailed on Defra's MAGIC map) is used for the wider conservation area for the Sussex Bat SACs and significant impacts or severance to flightlines must be considered. This development is within the "wider conservation zone" for The Mens SAC, and therefore lies within a 'bat sustenance zone' for Barbastelle bats, a designated feature of The Men's SAC.

Ebernoe Common SAC also has Barbastelle and Bechstein's bats as designated features. This development lies outside the 12km wider conservation area for Ebernoe Common SAC, and therefore lies outside a 'bat sustenance zone'.

Potential for Adverse Effects on the Integrity (AEOI) of a Habitats site from the development in combination with other plans and projects.

Based on the scale of the proposed development, and the conclusions of the HDC Local Plan HRA, any further search using data from surrounding LPA planning portals for other projects was not considered necessary.

Horsham District Planning Framework (HDPF, 2015), Section 9.34 within Policy 31 states: In the case of The Men's SAC, development must not impact on bat flight paths in the district. As recommended in the Council's Habitat Regulations Assessment of this plan, a 'bat sustenance zone' has been identified and is shown on the Policies Map (see Appendix B). Within this area, it may be necessary for compensatory measures such as hedgerow enhancement to be undertaken prior to any development.

The HRA for the Chichester Local Plan (final version, URS, 2014), considers disturbance of bat flight lines from both The Men's and Ebernoe Common SACs. With regards to The Men's, they conclude that *'it is unlikely that development (in the Chichester Local Plan) would lead to a likely significant effect on The Men's SAC'*.

Other developments nearby over the past 5 years have comprised of smaller developments such as DC/24/0256 Change of use to two static caravans, Parsons Field, Pulborough, DC/23/1865, Erection of a new car dealership, Harwoods Garages, Pulborough and DC/24/1433 External building alterations, Goffsland Farm, West Chiltington. Larger developments have included DC/24/0069 erection of 20 dwellings, Land at Ryecrofts, Storrington and DC/21/0749 Reserved matters application for the erection of up to 62 residential units following approval of outline application DC/19/2015 on Land North of Downsview Avenue Storrington RH20 4LU.

Other developments within the wider conservation zone for The Mens SAC include the HRA Appropriate Assessment (Place Services, May 2020) for Land at Lyons Farm Lyons Road Slinfold (DC/19/1723) for an outline application for the erection of a continuing care retirement community, concluded with mitigation secured, no adverse effect on site integrity of The

	Mens SAC either alone or in combination with other plans and projects and Natural England agreed with this decision. This was refused consent and a decision of appeal APP/Z3825/W/20/3265874 is still awaited as the Hearing is in progress. The HRA Appropriate Assessment (Place Services, June 2020) for Land at Wellcross Farm Broadbridge Heath (DC/19/1897) which was allowed at appeal (APP/Z3825/W/20/3262938) also for an outline application for the erection of a continuing care retirement community, concluded with mitigation secured, no adverse effect on site integrity of The Mens SAC or Ebernoe Common either alone or in combination with other plans and projects and Natural England agreed with this decision. The HRA Appropriate Assessment (Place Services, Feb 2021) for Land at Duckmoor East of Billingshurst (DC/20/2607) for an Outline Application for the development of 83 residential units, landscaping, access, parking and associated infrastructure on land at Duckmoor, East Billingshurst concluded that with mitigation secured the project will avoid an Adverse Effect on the Integrity of the Habitats sites listed in this assessment, either alone or in combination with other plan and projects. The application was refused consent but allowed at appeal (APP/Z3825/W/21/3283823). Natural England has confirmed that it has no objection to the development, providing all relevant mitigation is secured in any planning permission which the Inspector has included in the decision notice. Additional HRA Appropriate Assessment for development in the locality which have been deemed to have, with mitigation secured, no adverse effect on site integrity of The Mens SAC or Ebernoe Common either alone or in combination with other plans and projects include: DC/22/0141 (Cattlestone Farm, Pulborough), SDNP/20/05831/FUL (Pulborough Garden Centre), DC/21/2530 (Land South of East Street Billingshurst), DC/20/2567 (Billhook Farm West, Billingshurst), DC/19/02952 (Land at Platts Roundabout, Billingshurst) and DC/22/0141 (Cattlestone Farm, West Chiltington). Other developments nearby over the past 7 years have comprised of smaller developments such as extensions and building conversions. No in - combination effects are therefore considered likely to result from the on-site proposals and these small-scale developments. Any development proposals in the wider area around Pulborough will need to be assessed within the Horsham Local Plan HRA Appropriate Assessment or bespoke assessments at application stage. Given the above, and once the mitigation and compensation measures have been incorporated and secured, there is no potential for significant impacts from the proposals, it is considered that there is no potential for the development proposals to contribute to any adverse effects on integrity, in combination with other plans and projects.
Proposed mitigation for the project to secure the mitigation as a condition of any consent	Summary of mitigation package: • retain and enhance existing hedgerows and treelines for foraging and commuting bats, to create new wetland habitats and to implement a long-term management strategy to maintain high-quality habitats • In order to minimise the effects of artificial lighting on foraging and commuting bats, the new residential development will incorporate a 'sensitive lighting plan', prepared as part of the detailed design in accordance with the guidelines set out by the Bat Conservation Trust.

	These measures are considered appropriate to avoid adverse effects on the integrity of the interest features (Barbastelle bats) of The Mens SAC. These will be secured by a condition of any consent.
Test 2 – the integrity test	Conclusion: Having considered the proposed avoidance and mitigation measures above, Horsham District Council concludes that, the project will avoid an Adverse Effect on the Integrity of The Mens SAC or Ebernoe Common SAC, either alone or in combination with other plan and projects. As the mitigation has been considered after HRA screening, this HRA Appropriate Assessment is in line with the People over Wind CJEU Court ruling. Having made this appropriate assessment of the implications of the plan or project for the sites in view of the Sussex bat SACs' conservation objectives and having consulted Natural England and fully considered any representation received where necessary, the authority must now consider its separate water neutrality Appropriate Assessment before it can agree to the plan or project under regulation 63 of the Conservation of Habitats and Species Regulations 2017 (as amended).

Approving Ecologist: Hayley Dean
Date: 23rd September 2026

DISCLAIMER: This information has been produced by Place Services's Ecology Team on behalf of Horsham District Council, at their request.
