1. INTRODUCTION

1.1. Ardent Consulting Engineers (ACE) has been commissioned by Bellway Homes Ltd (South London), to carry out a Flood Risk Assessment (FRA) and Drainage Strategy for the proposed development at Church Lane in Ashington (herein referred to as the 'Site'). The proposed development consists of 180 units with public open space situated to the west of the Site. The public open space incorporates a sports pavilion, multi-use games area and attenuation basin.

1.2. The proposed Site currently has no planning status; however, it is an allocated site in the Ashington Neighbourhood Plan.

1.3. The wider site area is approximately 14.95ha, the developable area is approximately 6.61ha excluding the adjacent open spaces and sports fields.

1.4. The Environment Agency (EA) Flood Map shows that the Site is located within Flood Zone 1 however due to the scale of development, this FRA has been prepared to support the full planning application for the proposed development.

1.5. This FRA has been prepared in compliance with both the National Planning Policy Framework (NPPF), local planning policy and the supporting Planning Practice Guidance (PPG). It has also been written with reference to the Horsham Strategic Flood Risk Assessment and West Sussex LLFA policy for the management of surface water (2018), and West Sussex Preliminary Flood Risk Assessment (2011).

Scope

1.6. In accordance with the assessment criteria found in NPPF, this FRA will ultimately seek to;

- Ensure that flood mitigation is provided where/if required within the area to avoid detrimental impacts to third parties;
- Ensure that the impact of climate change is assessed;
- Ensure impermeable areas within the development are minimised where practicable; and
- Ensure the use of sustainable drainage systems (SuDS) is optimised in line with current best practice.

Sources of Information

1.7. Key reports/documents reviewed as part of this study are:

- Local Flood Risk Management Strategy for West Sussex County Council (May 2014);
- West Sussex Preliminary Flood Risk Assessment (2011);
- Horsham District Council Strategic Flood Risk Assessment (April 2010);
- West Sussex County Council Strategic Flood Risk Assessment (2010);
- West Sussex County Council LLFA Policy for the Management of Surface Water (November 2018);
- Topographical Survey Drawing by Maltby Surveys (Dec 2021)
- Southern Water Drainage Asset Plans;
- Flood Maps; and
- Site Investigation report by RSK Geosciences (January 2021)

Existing Site

1.8. The Site is located approximately twelve kilometres north of Worthing and twenty-two kilometres south-west of Crawley town centre. The National Grid Reference for the centre of the Site is TQ 12334 15967 (512334E, 115967N). A location plan is presented on Figure 1-1 below.

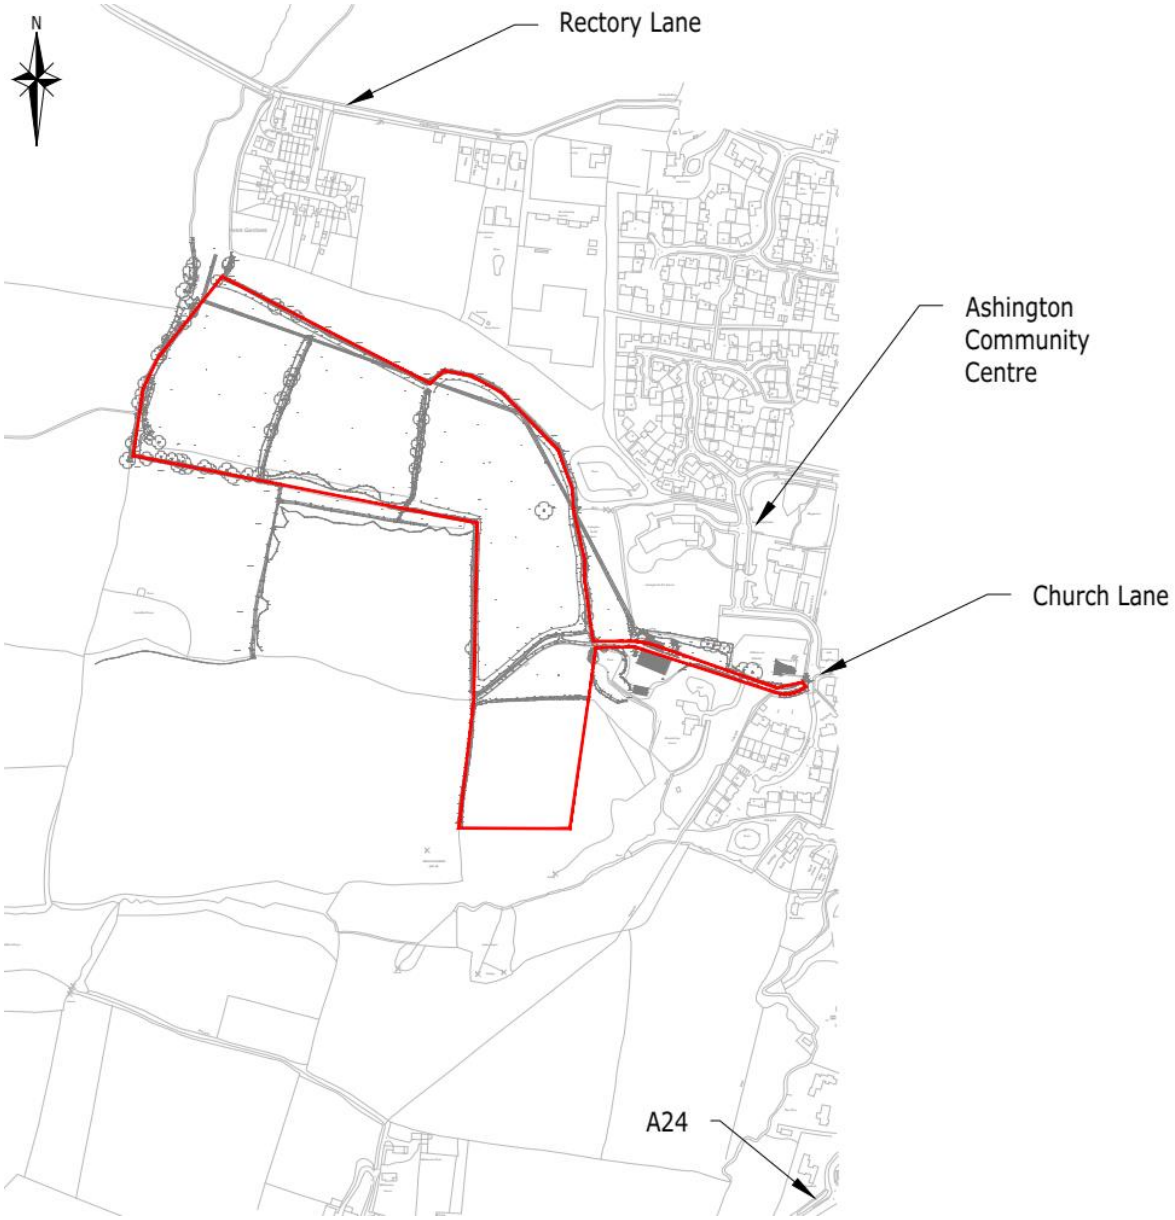

Figure 1-1: Site Location Plan

Development Proposals

1.9. The proposal is for a single development of 180 units with access provided towards the south-east of the site. West of the development, the public open space will include allotments, a multi-use games area (MUGA), a sports pavilion and associated infrastructure.

1.10. A extract of the latest site layout is shown below and included in **Appendix A**.

2. POLICY CONTEXT

National Planning Policy Framework

2.1. The National Planning Policy Framework (NPPF) was published in March 2012 and most recently updated on the 20 July 2021; paragraph 159 to 169 inclusive, establishes the Planning Policy relating to flood risk management. The Technical Guide to the NPPF has been superseded by the Planning Practice Guidance (PPG) in March 2014

2.2. The main focus of the policy is to direct development towards areas of the lowest practicable flood risk and to ensure that all development is safe, without increasing flood risk elsewhere. The main considerations are:

- Applying the Sequential Test, and if necessary, apply the Exception Test;
- Safeguarding land from development that is required for current and future flood management;
- Using opportunities offered by new development to reduce the causes and impacts of flooding; and,
- Where climate change is expected to increase flood risk so that some existing development may not be sustainable in the long-term, seeking opportunities to facilitate the relocation of development, including housing, to more sustainable locations.

2.3. The NPPF states that a Flood Risk Assessment is required *"for proposals of 1 hectare or greater in Flood Zone 1; all proposals for new development (including minor development and change of use) in Flood Zones 2 and 3, or in an area within Flood Zone 1 where proposed development or a change of use to a more vulnerable class may be subject to other sources of flooding."*

2.4. For the NPPF Exception Test to be passed:

- The development is appropriately flood resistant and resilient such that, in the event of a flood, it could be quickly brought back into use without significant refurbishment; and,
- *"A site-specific flood risk assessment must demonstrate that the development will be safe for its lifetime taking account of the vulnerability of its users, without increasing flood risk elsewhere, and, where possible, will reduce flood risk overall."*

2.5. The first point of the Exception Test is for the Local Planning Authority (LPA) to consider the supporting information provided as part of the Planning Submission and considers the proposals as a whole. The second element should be demonstrated by a suitably detailed Flood Risk Assessment.

2.6. The Planning Practice Guidance (PPG) provides the methodology required to undertake the Sequential and Exception Tests. The PPG classifies the proposed residential element of the development as 'More Vulnerable', therefore in Flood Zone 3 the Exception Test would also need to be passed for the scheme.

Planning Practice Guidance

2.7. The accompanying practice guidance to the NPPF provides additional guidance to local planning authorities to ensure the effective implementation of the planning policy set out in the National Planning Policy Framework on development in areas at risk of flooding.

2.8. The practice guidance provides supporting information on:

- The application of the sequential approach and Sequential and Exception Tests;
- Measures to reduce flood risk to acceptable levels;
- How to manage residual risks; and
- Guidance on how to take climate change into account.

2.9. The May 2015 update to the practice guidance provides additional guidance on Sustainable Drainage Systems (SuDS), including:

- The importance of SuDS;
- When SuDS should be considered;
- The SuDS discharge hierarchy;
- Factors a local authority will address when considering SuDS as part of a planning application;
- When SuDS are inappropriate and relevant flood risk consultees;
- Applicability of Defra's Non-Statutory Technical Standards for Sustainable Drainage Systems;
- Design and construction cost considerations;

- Operation and maintenance considerations; and
- Where to go for further SuDS advice.

2.10. As part of the May 2015 update, the practice guidance provides details on the parties responsible for assessing the suitability of SuDS practices. As per paragraph 84 from the practice guidance:

"The decision on whether a sustainable drainage system would be inappropriate in relation to a particular development proposal is a matter of judgement for the local planning authority. In making this judgement the local planning authority will seek advice from the relevant flood risk management bodies, principally the lead local flood authority, including on what sort of sustainable drainage system they would consider to be reasonably practicable"

Sustainable Drainage Systems - Non-statutory technical standards for sustainable drainage systems (March 2015)

2.11. The Non-statutory technical standards for sustainable drainage systems were published in March 2015. This document sets out non-statutory technical standards for sustainable drainage systems. They should be used in conjunction with the Planning Practice Guidance. In addition, the Best Practice Guidance for the Planning Practice Guidance was published in July 2015.

2.12. The Local Planning Authority (LPA) may set local requirements for planning permission that have the effect of more stringent requirements than these non-statutory technical standards.

2.13. In addition, SuDS should be designed in accordance with CIRIA 753 SuDS Manual, which represents current best practice.

Regional & Local Planning Policy Review

2.14. In the preparation of this report, specific reference is made to the following regional and local planning policy pertinent to flood risk:

- Horsham District Planning Framework (Nov 2015);
- Horsham District Council Strategic Flood Risk Assessment (April 2010);
- Local Flood Risk Management Strategy for West Sussex County Council (May 2014);
- West Sussex County Council Strategic Flood Risk Assessment (2010);

- West Sussex LLFA Policy for the Management of Surface Water (November 2018).

2.15. Collectively the above documents provide a strategy for not only assessing flood risk at a regional level but also guidance on the management of surface water on a site-specific basis.

3. BASELINE CONDITIONS

Topography

3.1. A topographical survey was carried out by Maltby Surveys in December 2021 . A copy of the topographic survey is included in **Appendix B** and shows that the site falls generally from the south-east corner towards the north-west. The highest ground levels are circa 30.50m AOD and the lowest levels recorded are circa 24.50m AOD. The site is surrounded by several ditches, forming the northern and western boundary, with another ditch running north through the centre of the site.

3.2. The average gradient across the site falls at approximately 1 in 140 toward the north-west corner.

3.3. A review of the historical maps indicates that the site and the surrounding area have been utilised as agricultural land since the earliest ordnance survey map issued in 1879. The topographic survey plans show the site remains predominantly ex agricultural land with ditches and trees present on site.

Existing Sewers

3.4. Sewer records obtained from Southern Water indicate that there are 150mm and 225mm diameter foul sewers located on Church Lane flowing north toward Rectory Lane. Church Lane is to the east of the site and therefore on the high side of the site. This will require a foul water pump station to be installed.

3.5. There is no suitable surface water network within or adjacent to the site. It is proposed that the site will drain (to greenfield run-off rates) via gravity to the ditch in the north-west corner of the site.

Hydrology

3.6. There are no designated rivers within proximity of the site. However, a small unnamed watercourse begins in the south eastern portion of the site, running north towards a farm pond which is just outside of the eastern boundary. The watercourse then flows out of the

pond, north along the eastern side of the boundary. At the north eastern corner of the site, the watercourse takes a turn west, where it runs parallel to the northern site boundary, roughly 20m within the site boundary. It then runs almost exclusively within ditches surrounded by overgrown hedgerow.

Ground conditions

3.7. According to the British Geological Survey (BGS) online datasets, for the majority of the site the bedrock is made up of the Weald Clay Formation overlain by occasional head deposits of clays, silts, sands and gravels.

3.8. An intrusive ground investigation was undertaken by RSK Geosciences in January 2021. The investigation confirmed that the Site is underlain by a variable thickness of topsoil over either Atherfield or Weald Clay. A copy of the report is included in **Appendix C**.

3.9. Infiltration testing was carried out at three locations across the site. The results of the testing indicate that test pits did not empty sufficiently over a 4-hour period to obtain BRE 365 compliant results. Insufficient infiltration rates were observed across all soakaway tests and indicate that ground conditions at the Site would not support infiltration drainage methods.

3.10. The lack of permeability and presence of clay soils has been reflected in the microdrainage parameters below when calculating greenfield runoff rates.

4. SOURCES OF FLOODING

4.1. The NPPF requires flood risk from the following sources to be assessed, each of which are assessed separately below:

- Fluvial sources (river flooding);
- Tidal sources (flooding from the sea);
- Groundwater sources;
- Pluvial sources (flooding resulting from overland flows);
- Sewer / Drainage flooding;
- Artificial sources, canals, reservoirs etc.; and,
- It also requires the risk from increases in surface water discharge to be assessed (surface water management).

Fluvial/Tidal Flooding

4.2. The Environment Agency's mapping indicates that the majority of the Site is located within Flood Zone 1. This means that the site has less than a 1 in 1,000 (0.1%) annual probability of river or sea flooding (low probability). An extract from the Environment Agency's Flood Risk Map for Planning is shown in **Figure 4-1** below.

Figure 4-1: Excerpt from EA Flood Risk Map for Planning

Groundwater Flooding

4.3. According to the Environment Agency's (EA) mapping website, the site is not located within a Source Protection Zone.

4.4. The Horsham SFRA does not include information for local groundwater flood risk but refers to Groundwater Vulnerability Mapping by the EA. The mapping shows the site to sit between "Low" and "Unproductive", therefore considered to be at very low risk of groundwater flooding.

4.5. Some trial pits and window samples installed on site as part of the site investigation encountered seepage of groundwater at depths between 1.5m and 2.4m however this is thought to represent perched water rather than a continuous body. Refer to **Appendix C** for copies of the trial pit logs.

Pluvial Flooding

4.6. The EA flood map for surface water indicates that the majority of the Site is at very low risk to low risk of surface water flooding (probability between <0.1% - 1.0% AEP). The area shown as high risk is to be expected due to the watercourses surrounding the site. An excerpt from the Environment Agency Flood Risk Map for Surface Water is presented in **Figure 4-2** below.

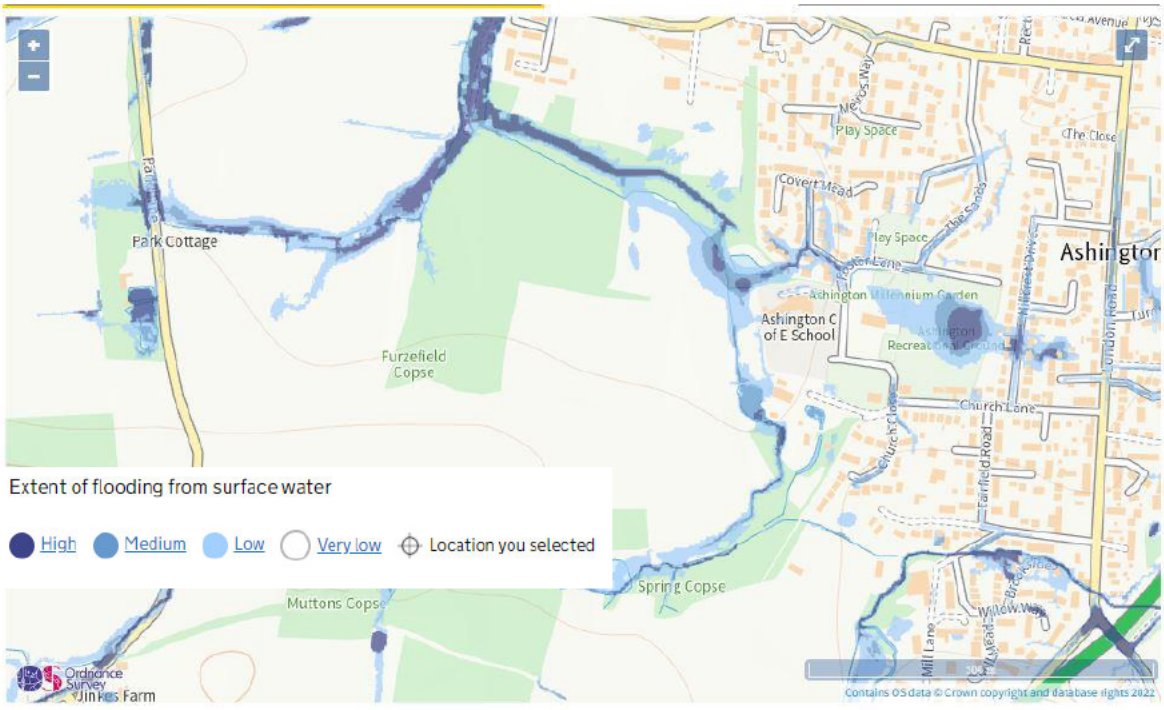

Figure 4-2: Excerpt from EA Flood Risk Map for Surface Water

4.7. The surface water mapping and topography of the site show that the site is within a separate catchment to the flood risk affecting Mill Lane referenced in 'Policy ASH7: Addressing Flooding in Mill Lane' in the Ashington Neighbourhood Plan. This development is not considered suitable to alleviate flooding in the adjacent catchments and so the design will focus on managing the flood risk of the site itself.

Artificial Sources

4.8. The Environment Agency's flood risk from reservoirs map indicates that the Site is not within an area at risk of flooding from reservoirs, canals or other artificial water bodies.

5. FOUL AND SURFACE WATER MANAGEMENT

5.1. The LLFA is West Sussex County Council, who are responsible for reviewing the surface water drainage systems for major developments (ten dwellings or more).

5.2. A non-statutory technical standard for sustainable drainage systems was published by the Department of Environment, Food and Rural Affairs in March 2015 to guide planning authorities, designers and developers on the use of SuDS. A Best Practice Guidance was published by the Local Authority SuDS Officer Organisation (LASOO) in July 2015 to accompany the aforementioned document.

5.3. The CIRIA guidance C753 (The SuDS Manual) has been used to determine the appropriate SuDS strategy, which considers the spatial and environmental constraints of the site.

5.4. The Guidance to Support the NPPF (Climate Change Allowance for Planners) was updated in February 2019. The new guidance document considers 'Upper end' and 'Central' scenarios for peak rainfall intensity allowances in small urban catchments due to climate change,.

5.5. In May 2022 the EA updated peak rainfall allowances to reflect the latest projections which resulted in allowances being sub-divided into management catchments rather than national allowances. The site sits in the Adur and Ouse Management Catchment and the central and upper allowances are shown in **Table 5-1** below.

Table 5-1: Peak Rainfall Intensity Allowance in Small Urban Catchments

Peak Rainfall Scenario	Total Potential Change for 2040 to 2060	Total Potential Change for 2061 to 2115
Upper end	45%	45%
Central	20%	25%

5.6. Therefore, under this guidance, an allowance of 45% for the effects of climate change would achieve the policy requirements for the proposed development.

Existing Surface Water Discharge

5.7. The Topographical survey indicates that the Site slopes towards the north-western corner. Surface water runoff from the site will run-off towards the surrounding field ditches.

5.8. In line with CIRIA guidance C753 (The SuDS manual), greenfield runoff rates have been calculated using the ICP SuDS method using MicroDrainage and are included in **Appendix D**. The existing Greenfield run off rates have been calculated for the proposed developable areas of the site as follows:

- 1 Year Greenfield runoff = 12.9 l/s;
- QBar Greenfield runoff = 15.2 l/s;
- 30 Year Greenfield runoff = 34.4 l/s; and
- 100 Year Greenfield runoff = 48.4 l/s.

5.9. Based on the ground condition encountered the soil index value is anticipated to be 0.400 however 0.300 has been used in the greenfield runoff calculations for robustness.

Soil Index	General Description	Soil Type
0.150	i) Well drained permeable sandy or loamy soils and shallower analogues over highly permeable limestone, chalk, sandstone or related drifts. ii) Earthy peat soil drained by dikes and pumps. iii) Less permeable soils in valleys.	1
0.300	i) Very permeable soils with shallow groundwater. ii) Permeable soils over rock or frangipani, commonly on slopes in western Britain associated with smaller areas of less permeable wet soils. iii) Moderately permeable soils, some with slowly permeable subsoils.	2
0.400	i) Relatively impermeable soils in boulder and sedimentary clays and in alluvium, especially in eastern England. ii) Permeable soils with shallow groundwater in low lying areas. iv) Mixed areas of permeable and impermeable soils in approximately equal proportions.	3
0.450	v)i) Clayey, or loamy over clayey soils with an impermeable layer at shallow depth.	4
0.500	Soils of the wet upland i) With peaty or humose surface horizons and impermeable layers at shallow depth. ii) Deep raw peat associated with gentle upland slopes or basin sites. iii) Bare rock cliffs and screes. vi) Shallow, permeable rocky soil on steep slopes.	5

Proposed Surface Water Drainage and Options consideration

5.10. In line with CIRIA guidance C753 (The SuDS manual), the drainage hierarchy needs to be considered and is listed below in order of preference:

- Store rainwater for later use;
- Use infiltration techniques, such as porous surfaces in non-clay areas;
- Attenuate rainwater by storing in tanks or sealed water features for gradual release to a watercourse;
- Discharge rainwater direct to a watercourse;
- Discharge rainwater to a surface water drain; and
- Discharge rainwater to the combined sewer.

Store rainwater for later use

5.11. The potential to reuse a percentage of the rainwater from the site on the proposed development should be explored further during detail design, in particular through the use of water butts. This assessment considers the worst-case runoff rates and assumes this option is not viable.

Use infiltration techniques, such as porous surfaces in non-clay areas

5.12. RSK Geosciences has confirmed that infiltration is not suitable for the site due to the clay soils and therefore is not feasible as a means of surface water discharge.

Discharge to a watercourse at greenfield rates

5.13. There is an existing ditch in the north-west of the Site, which the proposed drainage network will discharge to.

Proposed Sustainable Drainage Systems (SuDS)

5.14. **Table 5-2** below appraises the constraints and opportunities for the use of SuDS techniques within the Site and it adopts the management train approach outlined in CIRIA C753 'The SuDS Manual'.

Table 5-2: C753 SuDS Components - Management Train Approach

Type:	**Infiltration Devices** (Source Control)
Constraints:	The site is underlain by clay with poor infiltration capabilities.
Opportunities:	None.
Type:	**Lined Permeable Paving** (Source Control)
Constraints:	Permeable paving is not likely to be adopted by the local highway authority
Opportunities:	None within the main carriageways due to adoption limitations.
Type:	**Swales/Filter Drains** (Permeable Conveyance)
Constraints:	Limited opportunities within the development due to the development density and existing trees.
Opportunities:	A swale could be utilised before the water discharges into the ditch at the northwest of the site and adjacent to the proposed site access road.
Type:	**Attenuation Basin / Ponds** (end of pipe treatment)
Constraints:	Attenuation basins usually require large land take to accommodate enough storage for the whole development
Opportunities:	As there is an abundance of open space adjacent to the development area, an attenuation basin can be provided to the west of the site.
Type:	**Buried Storage** (end of pipe treatment)
Constraints:	None.
Opportunities:	None required at this stage, as a Basin can provide sufficient storage.

5.15. After consideration of the CIRIA C753 management train approach, the most viable SuDS option is the use of attenuation basins and swales/ditches.

5.16. The use of basins and swales in series will provide appropriate water quality treatment and will remove sediment prior to discharging into the existing ditch.

5.17. The development has been designed to discharge at the relevant greenfield rates for the site, prior to discharging to the existing ditch to the northwest of the site. The total storage required for the whole site is calculated to be 2774m^3 and has been provided within the attenuation basin on site.

5.18. The Site will discharge at the QBar greenfield runoff rate up to and including the 1 in 100 year rate plus 45% climate change storm event, mimicking the natural runoff of the site.

5.19. The surface water calculations are based on a measured impermeable area of 3.46ha, approximately 52% of the developable Site area. These are included in **Appendix E.**

5.20. The Proposed Drainage Strategy for the Site, drawing numbers 2108611-003/004 have been included in **Appendix F**.

Long Term Storage and Urban Creep

5.21. There will be an increase of impermeable area at the Site and subsequently an increase in the volume of runoff. As the site is discharged at Qbar rate no long term storage will be required.

Stages of Treatment

5.22. In terms of surface water treatment, the integration of the SuDS features outlined above allow for a SuDS management train approach to be applied to ensure that surface water runoff is of sufficient quality, so as not to cause pollutant-based detriment to the receiving ditch.

5.23. In determining the necessary SuDS treatment methods, reference is made to Table 26.2, Table 26.3 and Table 26.4 of the SuDS Manual (CIRIA C753), which have been duplicated in **Appendix G**. The tables outline the 'Simple Index Approach' which sets out the water treatment criteria in relation to land use and SuDS performance evidence. To ensure sufficient treatment is proposed for surface waters, the total pollution mitigation index of the selected SuDS methods must equal or exceed the pollution hazard index for the site.

5.24. The assessment has been carried out based on the use of a swales and an attenuation basin, which will provide treatment upstream of the discharge to the existing watercourse which will aid in pollution control.

Exceedance Routes

5.25. As a result of heavy or extreme storm events it is sometimes unavoidable for the capacities of sewers and other drainage systems to be exceeded. Drainage

exceedance will occur when the rate of surface water runoff exceeds the inlet capacity of the drainage system, when the receiving water or pipe system becomes overloaded, blocked or when the outfall becomes restricted due to flood levels in the receiving water.

5.26. The routes will ultimately mimic the current flow routes associated with the existing site as a result of the topography. Flow arrows have been added to the Proposed Drainage Strategy Plan within **Appendix F** to indicate the exceedance routes throughout the development.

Future Maintenance

5.27. It is the intention that the piped elements of the surface water network (up to the outfall into the proposed swale) will be adopted by Southern Water under a S104 agreement. The extent of the network proposed for adoption will be addressed at detailed design stage and agreed with Southern Water.

5.28. A management company or the LLFA will be appointed to maintain the SuDS elements of the surface water drainage strategy if required. Funding of the maintenance regime will be via the yearly maintenance fees from the development. All maintenance should be in accord with the best practices and the CIRIA Manual C753.

5.29. A maintenance and management plan for the SuDS features is included in **Appendix H.**

Proposed Foul Water Drainage

5.30. Due to the topography of the site, an adoptable pumping station will be required to drain the foul water.

5.31. It is proposed that the site will drain to the low point in the north-west of the site. The rising main will then run east and connect into the existing Southern Water foul network. The length of the proposed rising main is circa 815m.

5.32. The development foul discharges into MH 9801, which is owned by Southern Water.

6. FLOOD RISK MANAGEMENT

6.1. This site-specific FRA aims to demonstrate that the development will be safe for its lifetime taking account the vulnerability of its users, without increasing flood risk elsewhere, and, where possible, reduce flood risk overall.

6.2. The development is at low risk of flooding from various sources and the proposed runoff will be managed and discharged at a controlled rate to mimic the existing runoff.

6.3. The surrounding ditches will be maintained as part of the ongoing maintenance of the wider Site and this will help mitigate any localised flooding.

6.4. To minimise the impact on drainage during construction, regular sediment control should be implemented during any landscaping works to ensure the protection of the surrounding existing watercourses. Watercourse crossings/culverts shall be installed where appropriate to manage construction traffic and maintain the functionality of the watercourses at all times.

7. CONCLUSIONS

7.1. According to the EA the site is assessed to be within Flood Zone 1. The purpose of the site is suitable under these conditions.

7.2. Flood risk from groundwater, sewers, artificial sources, pluvial sources and overland flows are all considered to be low.

7.3. The intrusive ground investigation, carried out by RSK Geosciences, includes soakage testing and confirms that infiltration is not feasible on the Site.

7.4. In accordance with the requirements of Chapter 10 of the NPPF, the proposed development has been assessed for flood risk. Consideration has been given to flood risks affecting the Site, and also to flood risk elsewhere caused by the anticipated development. Based on our understanding of the site setting and the proposed development, it is considered that the proposed development can be constructed and operated safely and will not increase flood risk elsewhere.

RSK Environment Limited (RSK) has prepared this report for the sole use of the client, showing reasonable skill and care, for the intended purposes as stated in the agreement under which this work was completed. The report may not be relied upon by any other party without the express agreement of the client and RSK. No other warranty, expressed or implied, is made as to the professional advice included in this report.

Where any data supplied by the client or from other sources have been used, it has been assumed that the information is correct. No respons bility can be accepted by RSK for inaccuracies in the data supplied by any other party. The conclusions and recommendations in this report are based on the assumption that all relevant information has been supplied by those bodies from whom it was requested.

This work has been undertaken in accordance with the quality management system of RSK Environment Ltd. No part of this report may be copied or duplicated without the express permission of RSK and the party for whom it was prepared.

Where field investigations have been carried out, these have been restricted to a level of detail required to achieve the stated objectives of the work.

Appendix L Generic Assessment criteria for phytotoxic effects
Appendix M Generic Assessment criteria potable water supply pipes
Appendix N WM3 assessment

1 INTRODUCTION

1.1 Commissioning

RSK Environment Limited (RSK) was commissioned by Bellway Homes Ltd to carry out a Phase 1 and Phase 2 Geo-environmental Factual and Interpretive Report of the land at Church Lane, Ashington Church Lane, Ashington RH20 3JX. The project was carried out to an agreed brief as set out in RSK's proposal (Ref. T52368, dated 2nd November 2021).

RSK's service constraints are shown in Appendix A.

The Site in question is being considered for development for residential use. Plans for the development have been included in Appendix B.

1.2 Objectives

The objective of the work is:

- to identify any land contamination and/or geotechnical constraints to the proposed development and to support discharge of relevant planning conditions and relevant building control requirements
- to identify the need for any additional investigation or remediation works to demonstrate that the site is suitable for its proposed use

1.3 Scope of works

The scope of this assessment has been developed in accordance with relevant British Standards and authoritative technical guidance as referenced through the report. The assessment of the contamination status of the site is in line with the technical approach presented in Land Contamination Risk Management (LCRM) (Environment Agency, 2021) – which supersedes CLR11 Model Procedures for Land Contamination – and in general accordance with BS 10175: 2011 + A2 2017 (BSI, 2017). It is also compliant with relevant planning policy and guidance.

The scope of the intrusive investigation has been designed in line with the recommendations of BS5930:2015+A1:2020 Code of practice for ground investigations (BSI, 2020), which maintains compliance with BS EN 1997-1 and 1997-2 and their related standards. It has also been developed in general accordance with BS 10175: 2011 + A2 2017. Ground gas assessment has been undertaken in general accordance with BS8576: 2013 and BS 8485:2015+A1:2019.

A brief summary of relevant legislation and policy relating to land contamination is given in Appendix C.

The scope of works for the assessment has included the following:

Desk Study:

- review of the history of development on the site and surroundings
- assessment of local geology, hydrogeology and hydrology

- completion of a site reconnaissance survey to assess the visual condition of the site
- development of an initial conceptual site model (CSM)
- preliminary consideration of geotechnical constraints and hazards

Intrusive Investigation

- design and implementation of an intrusive investigation, in situ testing, soil sampling, laboratory geo-environmental and geotechnical testing, groundwater and ground gas monitoring of installed boreholes
- interpretation of data to develop a refined conceptual site model (CSM)
- generic quantitative risk assessment (GQRA) of relevant contaminant linkages
- interpretation of ground conditions and geotechnical data to provide preliminary recommendations with respect to foundations and infrastructure design
- preparation of this factual and/or interpretative report.

1.4 Existing reports

No existing reports relevant to the site assessment have been provided to RSK.

2 SITE DETAILS

2.1 Site location

Site location details are presented in Table 1 and a site location plan is provided on Figure 1.

Table 1 Site location details

Site name	Church Lane, Ashington
Full site address and RH20 3JX	Church Lane, Ashington RH20 3JX
National Grid reference (centre of site)	TQ126160

2.2 Site description

The Site boundary and current site layout are shown on Figure 2. The Site covers an area of c. 15.35 hectares. It is currently occupied by open agricultural fields bounded by hedgerow, with some wooded areas in the north west of the site.

2.3 Surrounding land uses

The Site is located in Ashington, within a predominantly agricultural setting. Immediate surrounding land uses are described in Table 2.

Table 2 Surrounding land uses

North	Private residential properties and open scrubland.
East	Private residential properties and a school.
South	Open agricultural fields and woodland further afield.
West	Open agricultural fields.

2.4 Development plans

The proposed layout of the site, at the time of preparing this report, is shown in Appendix B. The proposed development comprises private residential homes with associated driveways, soft landscaping frontage and rear gardens, as well as areas of public open space and sports pitches.

3 DESK-BASED ASSESSMENT

The desktop study was designed generally to meet the objectives of a preliminary (phase 1) investigation, as defined by BS 10175:2011 + A2 2017 (BSI, 2017) and this assessment relates to LCRM Stage 1, Tier 1 preliminary risk assessment. The "vicinity" of the site for the purposes of this report is defined as locations situated within an approximate 250 m radius of the site, although certain sources and/ or sensitive targets further than 250 m may also have been considered.

The study aims principally to identify and assess the potential risks and liabilities associated with contamination of the ground, on and in the vicinity of the site. While this includes consideration of current operations and housekeeping on the site, the report does not constitute a comprehensive environmental audit of the site, as covered under ISO 14001.

3.1 Site history

3.1.1 Historical development record

The development history of the site and surrounding area based upon assessment of historical plans and records is detailed in Table 3. The historical maps reviewed are shown within the environmental database report in Appendix D.

Table 3 Summary of historical development

Date from	Date to	Historical Land Use (on-site)	Area of site
1879	Present	Open agricultural fields bounded by hedgerow and small wooded areas.	Entire site
1982	Present	Concrete track entering the site from Church Lane to the east.	Eastern most portion of the site
Date from	**Date to**	**Historical Land Use (off-site)**	**Distance (m) and orientation**
1879	Present	Open agricultural fields bounded by hedgerow and small wooded areas, with sparse farmyards and houses. Several nurseries appearing from 1960s onwards.	0m – 1000m+ north, north east, south, south west, west and north west.
1948	Present	Penn gardens private residential housing.	0m – 100m north
1952	Present	Tank / reservoir.	0m north
1879	2000	School	100m north east

1879	Present	Ashington village – private residential homes and associated infrastructure gradually expanding over time until 2006. Most of the development took place between 1952 and 2006.	0m – 400m north east, east, south east.
2006	Present	School	50m east
2006	Present	Pond appears	Adjacent to the north east
1879	Present	Heath Common village – private residential homes and associated infrastructure gradually expanding over time until 1982. Most of the development took place between 1961 and 1982.	1000m+ south west
1879	Present	A24 London Road, appears to have expanded in the 1980s.	200+ m south east
Relevant information sources: Historical OS maps ☒ Town plans ☐ Information from the Local Planning Authority ☐ Aerial photography ☐ Previous reports ☐			
Note: Reference to published historical maps provides invaluable information regarding the land use history of the site, but historical evidence may be incomplete for the period pre-dating the first edition and between successive maps.			

A review of the historical maps indicates that the site and the surrounding area have been utilised as agricultural land since the earliest ordnance survey map issued in 1879. As Agricultural land there is the potential for contamination from the historical use of pesticides and herbicides. No other potential sources of contamination have been identified from the map records.

Immediately off site a number of potential receptors have been identified including private residential and a school.

3.1.2 Unexploded ordnance

A review of publicly available unexploded ordnance (UXO) risk maps indicates that the site is located in an area with 'low' potential for wartime bombs to be present (Zetica, 2021).

3.2 Information from environmental database report

Relevant environmental permits and incidents detailed within the environmental database report (see Appendix D) are summarised below in Table 4.

Table 4 Summary of environmental permits, landfills and incidents

Data type	Entries on-site	Entries <250m from site	Entries >250m from site of relevance	Details
Agency and hydrological				
Environmental permits – incorporating Integrated Pollution Prevention and Control, Integrated Pollution Controls, Local Authority Integrated Pollution Prevention and Control	-	-	-	n/a
Enforcement and prohibition notices	-	-	-	n/a

Data type	Entries on-site	Entries <250m from site	Entries >250m from site of relevance	Details
Pollution incidents to controlled waters, Prosecutions relating to controlled waters, Substantiated pollution incident register, Water Industry Act referrals	-	5	-	Off-site <250m: Sewage pumping station 87m north, sewage overflowing manhole into stream 27.06.1997, ref: 2181. Sewage pumping station 101m north, crude sewage entering watercourse 30.12.1997, ref: 2355. Sewage pumping station 106m north, pumping main burst crude sewage entering watercourse 20.05.1996, ref: 1690. Sewage pumping station 149m north, containment failure crude sewage entering watercourse 12.10.1999, ref: 3256. Sewage pumping station 154m north, sewage discharge surcharging manhole 03.10.1995, ref: 1509.

Data type	Entries on-site	Entries <250m from site	Entries >250m from site of relevance	Details
Discharge consents	-	3	-	Off-site <250m: Pumping station on sewerage network 73m east, sewerage discharges into an unnamed tributary of Lancing Brook, ref: P07398. School/college 206m east, discharge of other matter surface water to freshwater river, ref: S01822, revoked: 01.07.1991 Domestic property sewage discharge – treated effluent into soakaway 232m south, ref: P07477
Registered radioactive substances	-	-	-	n/a
Landfill and waste				
Active landfills	-	-	-	n/a
Historic / closed landfills	-	-	-	n/a
Other waste management licences	-	-	-	n/a

Data type	Entries on-site	Entries <250m from site	Entries >250m from site of relevance	Details
Potentially in-filled land (pit, quarry, pond, marsh, river, stream, dock etc)	-	2	-	Off-site <250m of relevance: 54m east, unknown filled ground (pond, marsh, river, stream, dock etc.), mapped 1961. 228m south east, unknown filled ground (pond, marsh, river, stream, dock etc.), mapped 1961.
Hazardous substances/ industrial land uses				
Control of Major Accident Hazards (COMAH) sites	-	-	-	n/a
Explosives sites, Notification of Installations Handling Hazardous Substances (NIHHS), Planning hazardous substance consents/ enforcements	-	-	-	n/a
Contaminated land Part 2A register entries and notices	-	-	-	n/a
Contemporary trade directory entries	-	-	-	None within 500m with contaminative potential.
Fuel station entries	-	-	-	n/a
Note: Entries have only been included within the table where they are located within a 250m radius of the site or, where they fall outside of this radius but are considered to comprise a significant entry.				

3.3 Site geology

3.3.1 Anticipated geological sequence

Published records (British Geological Survey, 2021) for the area and available historical borehole logs indicate the presence of superficial head deposits covering a large proportion of the north east side of the site while no superficial deposits are mapped on the south western half. The majority of the site is underlain by the bedrock of the Weald Clay Formation (both mudstone and sandstone units) with the Atherfield Clay Formation

mapped along the southern boundary. Alluvial deposits may also be present near the site entrance on the far east side of the site. The geology of the site to be characterised by the succession recorded in Table 5. An historical BGS borehole record (ref: TQ11NW1) located at NGR 512650,116400 approximately 250 m north of the site shows Weald Clay present from surface to the termination depth of the borehole at 46mbgl.

Table 5 Site geology

Strata	Description	Estimated thickness	Permeability
Superficial			
Head Deposits mapped across the north east corner of the site	Clay, silt, sand and gravel.	Variable.	Variable depending on composition.
Alluvium (potentially present on site near to the site entrance.	Clay, silt, sand and gravel	Variable.	Variable depending on composition.
Bedrock			
Atherfield Clay Formation mapped along the southern boundary	Yellowish brown to pale grey sandy mudstone, with an impersistent phosphatic pebble bed with vertebrate bones, gritty sandstone or very shelly sandy mudstone with glauconite, at the base.	18m	Low
Weald Clay Formation – mudstone (majority of the site) and sandstone (northern portion of the site only)	Dark grey thinly bedded mudstones (shales) and mudstones with subordinate siltstones, fine- to medium-grained sandstones, including calcareous sandstone, shelly limestones and clay ironstones.	122m – 460m	Low
Relevant information sources: BGS Geoindex ☒ BGS borehole logs ☒ Previous SI reports ☐			

While the site does not appear to have been developed at any point in time, anecdotal information provided by the landowner during the site walkover suggests that the nearby pond was once infilled, and its contents was then re-excavated in recent years. This relates to the potentially infilled pond 54m east of site. The material which was excavated from the pond was mounded west of the pond, just inside the site boundary. This area

forms the triangular shaped piece of land bordering the southernmost field. The mound is elevated approximately 2m to 3m above the surrounding landscape and is comprised of unknown material.

3.3.2 Radon

The environmental database report indicates that the site is not located within an 'Affected Area'. An 'Affected Area' is one with 1% or more homes above the radon Action Level of 200 Bq m^{-3}, and therefore the risk of significant ingress of radon into structures on-site is considered 'low' and protection measures are not necessary in the construction of non-domestic buildings.

Although the radon data used in production of the ukradon indicative atlas comes from measurements in homes, the maps indicate the likely extent of the local radon hazard in all buildings.

3.4 Mining and quarrying

Evidence has been sought to identify any mining, quarrying, landfilling and land reclamation operations, past and present, which have taken place within 500m of the site.

3.4.1 Coal mining area

An initial site appraisal has been carried out based on the information provided on the Coal Authority Interactive Viewer of the UK Coalfield areas.

This indicates the site lies outside the Coal Authority Consultation Area and is not located within a coalfield area.

3.4.2 Areas of other (rock or mineral) mining

The site does not lie in a non-coal mining area of the UK and has no history of mining of rocks or minerals of any sort.

3.5 Hydrogeology

A summary of the hydrogeological setting of the site, with respect to the anticipated geological sequence set out in Section 3.3 is presented below in Table 6.

Table 6 Summary of hydrogeological setting

Condition	Description
Aquifer characteristics	The northern and eastern portion of the site is underlain by a secondary undifferentiated aquifer relating to the aforementioned head deposits. The majority of the site is underlain by an unproductive strata relating to the Weald Clay Formation mudstone. Running parallel with the northern boundary of the site is a strip of land underlain by a secondary A aquifer relating to the Weald Clay Formation sandstone.

Condition	Description
	The presence of low permeability clay at relatively shallow depths beneath the site, while restricting downwards migration, may increase the potential for lateral migration of shallow groundwater (and therefore mobile contamination, if present).
Depth to groundwater and flow	BGS borehole record (ref: TQ11NW1) located at NGR 512650,116400 approximately 250 m north of the site has been used to estimate the potential depth to groundwater at the site. Based on groundwater observations made during the drilling of the borehole it is noted that strikes were recorded at 28mAOD (3mbgl), 20mAOD (11mbgl) and 14mAOD (16mbgl) with a resting water level of 27mAOD (4mbgl). The borehole is located at 31mAOD similar to the level of the site. Similar groundwater levels have therefore been assumed in the absence of onsite information. Shallow groundwater in the site area is anticipated to flow in a north easterly direction, i.e. towards and in the direction of flow of a tributary river of Lancing Brook which runs parallel with both the eastern and northern site boundaries.
Groundwater recharge/ attenuation	Most of the site is currently unsurfaced and will therefore drain to ground.
Licensed groundwater abstractions	The environmental database report indicates that there are three current licensed groundwater abstractions within a 1km radius of the site, none of which are public water supply boreholes. All three are associated with agricultural irrigation at the nearby Malthouse farm, 516m south of the site.
Source protection zones	Information available in the Envirocheck report indicates that the site does not lie within a currently designated groundwater Source Protection Zone (SPZ), with the nearest source protection zone (Zone III) being 618m north west.

3.6 Hydrology

A summary of the hydrology within the site area is summarised in Table 7.

Table 7 Summary of hydrology in site area

Condition	Description
Surface watercourses/features	A small stream begins in the south eastern portion of the site, running north towards a farm pond which is just outside of the eastern site boundary. The watercourse then flows out of the pond, north along the eastern site boundary. At the north eastern corner of the site, the stream takes a turn towards the west, where it runs parallel to the northern site boundary, roughly 20m within the site. The stream runs almost exclusively within ditches surrounded by overgrown hedgerow. The stream is very small and appears to fluctuate greatly depending on weather conditions.
Surface water abstractions	There are no surface water abstractions identified by the environmental database, within a 1 km radius of the site.
Site drainage	Surface drainage from the site appears to be discharged into drainage ditches bounding each field, which are all connected to the tributary stream of Lancing Brook, which runs along the eastern and northern site boundary.

Condition	Description
Preliminary flood risk assessment	The indicative floodplain map for the area, shows that the northern portion of the site lies within the designated floodplain of the tributary stream of Lancing Brook, which runs along the eastern and northern site boundary. Here, the risk of flooding from surface water is high, with a 30-year return. The majority of the site however is not at risk of flooding and the general area outside the tributary stream of Lancing Brook is classified as very low risk of flooding.

3.7 Sensitive land uses

Table 8 provides a summary of any environmentally sensitive areas identified within 250 m of the site based on the environmental database report.

Table 8 Environmentally sensitive areas

Feature	Present within 250m of site?	Details	Likely pathways from site?
International designations – Ramsar wetland, Special Area of Conservation (SAC), Special Protection Area (SPA)	No	n/a	n/a
National designations – Site of Special Scientific Interest (SSSI), National Nature Reserve (NNR), ancient woodland	No	n/a	n/a
Local designations – Local Nature Reserve, Site of Importance for Nature Conservation (SINC)	No	n/a	n/a
Nearest high sensitivity development, e.g. residential	Yes	Nearby school on eastern site boundary	Unlikely

4 SITE RECONNAISSANCE FINDINGS

A site reconnaissance survey was completed on 19th November 2021 by RSK. The characteristics of the site observed during the walkover and from current ordnance Survey maps are summarised in Table 9.

All areas of the site were accessible for the site reconnaissance survey, except from an overgrown area in the west of the site, where thick undergrowth limited access

A site plan is provided in Figure 2 with photographic records included in Appendix E detailing the main features identified below.

Whilst the walkover summary includes consideration of current operations and housekeeping on the site as potential sources of contamination, it does not constitute a comprehensive environmental audit of the site, as covered under ISO 14001.

Table 9 Site reconnaissance findings

Feature	Description
Physical characteristics	
Access constraints	None.
Site topography	The Site is essentially level, with a small mound noted in the east of the site near the farmyard, and drainage ditches at the edges of fields.
Surface cover	The site is covered mostly by agricultural fields and bounded by areas of hedgerow and woodland.
Site drainage	Surface drainage from the site appears to be discharged into drainage ditches bounding each field, which are all connected to the tributary stream of Lancing Brook, which runs along the eastern and northern site boundary.
Surface water	The nearest surface watercourse to the site appears to be the tributary stream of Lancing Brook, which runs through the site in the north, and adjacent to the site boundary in the east. There is also a large pond in the farmyard, adjacent to the south eastern site boundary. The aforementioned stream runs into the pond from the south and back out from the north. Water appeared clear and uncontaminated.
Trees and hedges	Vegetation present on-site comprises crops in agricultural fields bounded by hedgerows and areas of mature woodland, comprising various trees including some large oaks to the north of the site.
Invasive species	Based upon the walkover survey obvious evidence of Japanese Knotweed or other invasive species has not been identified on-site. However, it should be noted that a detailed survey of the possible presence or absence of invasive species is outside of the scope of investigation and consideration should be given to commissioning a specialist survey, as necessary. Caveat for time of year (Oct-Apr) if applicable due to dieback.
Existing buildings on-site	No buildings are present on-site, although a corner of a barn in the farmyard in the east of the site is included within the site boundary.

Feature	Description
Retaining walls and adjacent buildings on or close to site boundary	There are no such structures on or close to the site boundary.
Basements on-site	No evidence of existing or infilled basements was observed.
Made ground, earthworks and quarrying	None observed, except the access road in the east of the site.
Potentially unstable slopes on or close to site	None observed.
Buried and overhead services present	No evidence of buried services observed. Overhead services were noted crossing most of the field, running along the eastern boundary of the site.
Environmental characteristics	
Underground/ above ground storage tanks and pipework	None observed.
Potentially hazardous materials storage and use	None observed.
Asbestos-containing materials	No obvious asbestos construction materials were observed but a detailed survey of the buildings would be required to confirm the presence or otherwise of asbestos-containing materials.
Waste storage	None observed.
Fly-tipping	None observed.
Electricity sub-stations/ transformers	None observed on or close to site.
Evidence of possible land contamination on-site	None observed.
Potential off-site sources of ground contamination	None observed.

No potentially significant land contamination or geotechnical issues were identified during the site reconnaissance survey.

5 PRELIMINARY GEOTECHNICAL CONSTRAINTS

5.1 Preliminary geotechnical hazards assessment

A summary of commonly occurring geotechnical hazards associated with the anticipated geology outlined in Section 3.3 above is given in Table 10 together with an assessment of whether the site may be affected by each of the stated hazards.

Table 10 Summary of preliminary geotechnical risks that may affect site

Hazard category	Hazard status based on desk study findings and proposed development		Engineering considerations if hazard affects site
	Could be present and/or affect site	Unlikely to be present and/or affect site	
Sudden lateral changes in ground conditions associated with variable head deposits and bedrock and the potential for areas of deeper Made Ground.	☒	☐	Likely to affect ground engineering and foundation design and construction
Shrinkable clay soils associated with cohesive head deposits and underlying bedrock	☒	☐	Design to NHBC Standards Chapter 4 or similar
Highly compressible and low bearing capacity soils, (including peat and soft clay)	☒	☐	Likely to affect ground engineering and foundation design and construction
Silt-rich soils susceptible to rapid loss of strength in wet conditions	☒	☐	Likely to affect ground engineering and foundation design and construction
Running sand at and below water table potentially in granular lenses of the Head deposits.	☒	☐	Likely to affect ground engineering and foundation design and construction
Karstic dissolution features (including 'swallow holes' in Chalk terrain)	☐	☒	May affect ground engineering and foundation design and construction.
Evaporite dissolution features and/or subsidence	☐	☒	May affect ground engineering and foundation design and construction
Ground subject to or at risk from landslides	☐	☒	Likely to require special stabilisation measures

Hazard category	Hazard status based on desk study findings and proposed development		Engineering considerations if hazard affects site
	Could be present and/or affect site	Unlikely to be present and/or affect site	
Ground subject to peri-glacial valley cambering with gulls possibly present within the Weald Clay Formation	☒	☐	Likely to affect ground engineering and foundation design and construction
Ground subject to or at risk from coastal or river erosion	☐	☒	Likely to require special protection/stabilisation measures
High groundwater table (including waterlogged ground)	☒	☐	May affect temporary and permanent works
Rising groundwater table due to diminishing abstraction in urban area	☐	☒	May affect deep foundations, basements and tunnels
Geological faults, fissures and break lines	☐	☒	May affect ground engineering and foundation design and construction
Underground mining including shafts and adits (e.g. coal, mineral)	☐	☒	Likely to require further assessment including potentially special stabilisation measures
Effects of extreme temperature (e.g. cold stores or brick kilns/furnaces)	☐	☒	Likely to affect ground engineering and foundation design and construction
Existing sub-structures (e.g. tunnels, foundations, basements, and adjacent sub-structures)	☐	☒	Likely to affect ground engineering and foundation design and construction
Filled and made ground (including embankments, infilled ponds and quarries)	☒	☐	Likely to affect ground engineering and foundation design and construction
The Weald Clay is a Pyritic geology and therefore weathering of sulphides to sulphates creating adverse chemistry for foundations can be expected.	☒	☐	May affect ground engineering and foundation design and construction
Site topography	☐	☒	May affect ground engineering and foundation design and construction
Note: Seismicity is not included in the above table as this is not normally a design consideration in the UK.			

6 INITIAL CONCEPTUAL SITE MODEL

In the UK land contamination is assessed using a risk-based approach taking account of the magnitude (severity of the hazard) and likelihood (probability) of occurrence. A 'receptor' is something that could be adversely affected by contamination (e.g. people, an ecological system, property or a water body). A 'pathway' is a route or means by which a receptor is or could be exposed to or affected by a contaminant. A 'contaminant source' is a hazard but it can only pose a risk to a receptor where a pathway is present. The relationship between sources, pathways and receptors are referred to as a conceptual site model. A risk can only be released where a contaminant source, pathway and receptor are all in place, referred to as a 'pollutant linkage'.

In line with LCRM (Environment Agency, 2021) and BS 10175: 2011 + A2 2017 (BSI, 2017), RSK has used information in the preceding sections to identify hazards (sources of contaminants), receptors that may be impacted and plausible linking pathways. Where all three are present this is termed a potentially complete contaminant linkage and a qualitative risk estimation is made.

6.1 Potential soil, soil vapour and groundwater linkages

6.1.1 Potential sources of contamination

Potential sources of soil and groundwater contamination identified from current activities and the history of the site and surrounding area are presented in Table 11. Ground gas sources are addressed in the next section.

Table 11 Potential sources of soil and groundwater contamination

Potential sources	Contaminants of concern
On-site	
Made ground (i.e., fill material) - excavations from formerly infilled pond.	Unknown fill material but potentially including brick, ash and clinker and containing toxic and phytotoxic metals, inorganics, polycyclic aromatic hydrocarbons (PAHs), asbestos.
Agricultural land use - Herbicides and pesticide	Herbicides and pesticide
Off-site	
-	n/a

6.1.2 Sensitive receptors and linking exposure/ migration pathways

Sensitive receptors identified at or in the vicinity of the site that could be affected by the potential sources identified above comprise:

- future site users – residential users [oral, dermal and inhalation exposure with impacted soil, soil vapour and dust/fibres, ingestion of home-grown produce, inhalation of vapours from groundwater]

- current adjacent site users – School, residential and public open space users [migration of contamination via dust/fibre deposition, vapour or groundwater migration combined with inhalation]
- future buildings and services [direct contact with contaminated soils or groundwater and chemical attack]
- future vegetation [direct contact with contaminated soils or groundwater and root uptake leading to phytotoxicity]
- groundwater in secondary undifferentiated aquifer within the head deposits and secondary A aquifer within the Weald Clay Formation (sandstone) from soils/ percolation to aquifer/ lateral migration of dissolved phase]
- on site surface water course (tributary to Lancing Brook) [lateral migration of dissolved phase/ site run-off/ drainage]

Potential linking pathways are show in brackets for each item above.

Please note that construction workers and future maintenance workers have not been identified in the conceptual model as receptors because risks are considered to be managed through health and safety procedures according to the CDM Regulations.

Ecological receptors are only considered within the conceptual model in the context of statutory protected sites.

6.2 Potential ground gas linkages

6.2.1 Ground gas generation potential

Potential ground gas sources identified for the site and surrounding are shown in Table 12.

Table 12 Potential ground gas sources

Potential sources	Indicative ground gas generation potential (CIEH, 2008)	Additional information
On-site		
Made ground (i.e., fill material) - excavations from formerly infilled pond. with a potential TOC up to 6%	Low to very low	

No significant potential sources of ground gas generation have been identified therefore this potential issue has not been taken forward. Notwithstanding the above it is advised that a preliminary confirmatory round of ground gas monitoring is undertaken to confirm this assessment and that it should target this area of potential deeper made ground adjacent to the pond in the north east corner of the site.

Construction workers have not been identified as receptors for the purposes of this assessment. Risks may still be present to construction workers especially where works include the entry into excavations within the ground. Construction workers should undertake appropriate risk assessments and risks should be managed through health and safety procedures and the use of PPE.

6.3 Preliminary risk assessment

The preliminary risk assessment findings and potentially complete contaminant linkages are shown in Table 13 overleaf. The risk classification based on the combination of hazard consequence and probability using a risk matrix from CIRIA C552 (Rudland et al., 2001), a summary of which is included in Appendix F. This relates to Tier 1 preliminary risk assessment in LCRM (Environment Agency, 2021).

Table 13 Risk estimation for potentially complete contaminant linkages

Potential source	Potential receptor	Possible pathway	Likelihood	Severity	Potential risk	Justification
Made ground i.e., fill material - excavations from formerly infilled pond. Agricultural land use - Herbicides and pesticide	Future site users – residential users	Oral, dermal and inhalation exposure with impacted soil, soil vapour and dust/fibres, ingestion of home-grown produce, inhalation of vapours from groundwater	Low likelihood	Medium	Moderate/ Low	Potential for significant impact within soil at the site is considered low, however if present, it is possible that future site users may come into contact through areas of soft landscaping.
	Current adjacent site users – residential and public open space users	Migration of contamination via dust/fibre deposition, vapour or groundwater migration combined with inhalation	Low likelihood	Medium	Moderate/ Low	Potential for significant impact within soil at the site is considered low, however if present, it is possible that current adjacent site users may come into contact through areas of soft landscaping.
	Future buildings and services	Direct contact with contaminated soils or groundwater and chemical attack	Low likelihood	Mild	Low	Potential for significant impact within soil at the site is considered low, however if present, it is possible that buried concrete or potable water supply pipes may be affected. The Weald Clay Formation is Pyritic and thus weathering of sulphides to sulphates can have adverse consequences for below ground structures.

Potential source	Potential receptor	Possible pathway	Likelihood	Severity	Potential risk	Justification
	Future vegetation	direct contact with contaminated soils or groundwater and root uptake leading to phytotoxicity	ow likelihood	minor	Very low	It is considered unlikely that future vegetation would come in contact with made ground present on site and would instead be planted in a suitable growing medium. The severity of potential harm caused is considered to be minor.
	Groundwater in secondary undifferentiated aquifer within the head deposits and secondary A aquifer within the Weald Clay Formation (sandstone)	Leaching from soils/ percolation to aquifer/ lateral migration of dissolved phase	Low likelihood	Mild	Low	Potential for significant impact within soil at the site is considered low, however if present, it is possible that the secondary undifferentiated aquifer within the head deposits could be affected.
	On site surface water course (tributary to Lancing Brook)	Lateral migration of dissolved phase/ site run-off/ drainage	Low likelihood	Mild	Low	Potential for significant impact within soil at the site is considered moderate/ low, however if present, it is possible that the stream in the north of the site could be affected.

Risk matrix		Consequences			
		Severe	Medium	Mild	Minor
Probability	Highly likely	Very high	High	Moderate	Moderate/low
	Likely	High	Moderate	Moderate/low	Low
	Low likelihood	Moderate	Moderate/low	Low	Very low
	Unlikely	Moderate/low	Low	Very low	Very low

Potentially complete contaminant linkages with a potential risk of moderate to low or higher identified in in Table 13 comprise:

- future site users – residential users [oral, dermal and inhalation exposure with impacted soil, soil vapour and dust/fibres, ingestion of home-grown produce, inhalation of vapours from groundwater]
- current adjacent site users – residential and public open space users [migration of contamination via dust/fibre deposition, vapour or groundwater migration combined with inhalation]

These potentially complete contaminant linkages need to be assessed further through appropriate site investigation to target the identified sources of potential contamination and assess the feasibility of identified pathways.

7 SITE INVESTIGATION STRATEGY & METHODOLOGY

7.1 Introduction

RSK carried out intrusive investigation works and subsequent monitoring of boreholes between November 2021 and December 2021.

7.2 Objectives

The specific objectives of the investigation are as follows:

- to establish the ground conditions underlying the site including the extent and thickness of any made ground
- to investigate specific potential sources of contamination identified in initial CSM
- to determine the presence and depth of groundwater
- to determine the ground gas regime underlying the site
- to assess geotechnical properties of soils

7.3 Selection of investigation methods

The techniques adopted for the investigation were chosen with consideration of the objectives and site constraints, which are described below:

- 15no.mechanically excavated trial pits to a maximum depth of 3.00 mbgl, including hand vane tests at regular intervals where possible. 3no. selected trial pit locations were chosen to undertake soakaway testing.
- 5no. window sample boreholes were progressed to a maximum depth of 4.00 mbgl. Standard penetration testing (SPT) and hand vane tests were undertaken at regular intervals. Allowance was made to install 5no. borehole locations with monitoring wells to allow for future groundwater and ground gas sampling.
- 10no. Dynamic Cone Penetrometer (DCP) tests for determining CBR values were undertaken.
- 5no. hand dug pits to a maximum of 0.50 mbgl to collect bulk samples at shallow depths for CBR testing.

Prior to conducting intrusive works, utility service plans were obtained, and buried service clearance undertaken in line with RSK's health and safety procedures.

7.4 Investigation strategy

The ground investigation was carried out using intrusive ground investigation techniques in general accordance with the recommendations of BS5930:2015+A1:2020. Whilst every attempt was made to record full details of the strata encountered in the boreholes,

techniques of hole formation and sampling will inevitably lead to disturbance, mixing or loss of material in some soils and rocks.

Details of the investigation locations, installations and rationale are presented in Table 14. Logs have been included in Appendix G and an exploratory hole location plan is included as Figure 2.

Table 14 Exploratory hole and monitoring well location rationale

Investigation type	Number	Designation	Monitoring well installation	Rationale examples below
Boreholes by dynamic/ windowless sampling methods	5	WS1 to WS5	Gas and groundwater	To prove the geological succession beneath the site and obtain geotechnical data and to determine the contamination status of the ground beneath the site. Each location was installed with a dual-purpose groundwater and gas monitoring well to allow future groundwater and ground gas monitoring visits. Insitu SPT tests undertaken at 1.00m intervals. Hand vane tests were undertaken at regular intervals.
Trial-pits excavated by mechanical excavator	15	TP1 to TP15, TPS1 to TPS3	n/a	To prove the geological succession beneath the site and obtain geotechnical data and to determine the contamination status of the ground beneath the site. Hand vane tests were undertaken at regular intervals.
Trial pit soakage tests in general accordance with BRE 365	3	TPS1 to TPS3	n/a	To determine the soakage characteristics of the shallow geology and provide infiltration parameters for soakaway design.
Trial-pits excavated by hand	5	HP1 – HP5	n/a	To accurately log the upper strata in targeted locations beneath the site at locations

Investigation type	Number	Designation	Monitoring well installation	Rationale examples below
				beneath the proposed roads. Bulk samples were collected at each location for laboratory determination of the California Bearing Ration (CBR) of a compacted soil
In-situ testing (Dynamic Cone Penetrometer)	10	DCP1 – DCP10	n/a	To determine the subgrade strength for road and pavement design (i.e. California Bearing Ratio %).

7.4.1 Implementation of investigation works

The exploratory holes were logged by an engineer in general accordance with the recommendations of BS5930:2015+A1:2020 (which incorporates the requirements of BS EN ISO 14688-1, 14688-2 and 14689-1).

The monitoring well construction and associated response zones are detailed on the exploratory hole records in Appendix G.

The soil sampling and analysis strategy was designed to characterise each encountered soil strata, permit an assessment of the potential contaminant linkages identified and investigate the geotechnical characteristics. In addition, samples were taken to allow for geo-environmental and geotechnical testing to be undertaken.

Soils collected for laboratory analysis were placed in a variety of containers appropriate to the anticipated testing suite required. They were dispatched to the laboratory in cool boxes under chain of custody documentation. Samples were stored in accordance with the RSK quality procedures to maintain sample integrity and preservation and to minimise the chance of cross contamination.

Selected samples were placed in polythene bags for headspace screening with a photo-ionisation detector (PID) fitted with a 10.6 eV bulb. The PID screening results are presented on the exploratory hole records.

7.5 Monitoring programme

7.5.1 Ground gas monitoring

Three monitoring rounds have been undertaken to provide an initial assessment of ground gas risks.

A calibrated infrared gas meter was used to measure gas flow, concentrations of carbon dioxide (CO_2), methane (CH_4) and oxygen (O_2) in percentage by volume, while hydrogen sulphide (H_2S) and carbon monoxide (CO) were recorded in parts per million.

The atmospheric pressure before and during monitoring, together with the weather conditions, were recorded. The monitoring included periods of falling atmospheric pressures and after/during rainfall.

All ground gas monitoring results together with the temporal conditions are contained within Appendix G. Equipment calibration certificates are available on request.

7.6 Laboratory testing

Laboratory testing was undertaken at a UKAS accredited laboratory with ISO17025 and MCERTS accredited test methods were specified where applicable for contamination testing and as shown in the laboratory test certificates appended.

7.6.1 Chemical analysis of soil samples

The programme of chemical tests undertaken on soil samples obtained from the intrusive investigation is presented in Table 15 with the laboratory testing results contained in Appendix I.

Table 15 Summary of chemical testing of soil samples

Stratum	Tests undertaken	No. of tests
Made ground / topsoil	Metals (As, Cd, Cr, Cu, Hg, Pb, Ni, Se, Zn) and pH	12
	Total Organic Carbon (TOC)	6
	Speciated Total Petroleum Hydrocarbons (TPH C6-C40)	6
	Speciated Polyaromatic Hydrocarbons (PAH)	12
	Asbestos soil screen	12
	Hazardous Waste Suite (minimum suite) - pH, Metals, TPH with ID, PAH 17, Moisture content & Asbestos screen	1
	Full 1 batch waste suite - (Inert, SNRHW and Hazardous Landfill suite)	1
	Pesticide C suite - Combined organochlorine and organophosphorus	3
	Herbicides (Triazine herbicides)	3
	BRE Brownfield Pyritic (Soil) , total SO4 BRE and Total S	5

7.6.2 Geotechnical analysis of soils

Where appropriate disturbed, bulk and undisturbed soil samples were taken for geotechnical classification testing with the depth and nature of samples detailed within the exploratory hole records.

Where appropriate, testing was undertaken in accordance with BS 1377:1990 Method of Tests for Soils for Civil Engineering Purposes or, where superseded, by the relevant part of BS EN ISO 17892:2014 Geotechnical investigation and testing - Laboratory Testing of Soil. Tests carried out in order to classify the concrete class required on-site have been undertaken following the procedures within BRE SD1:2005.

The programme of geotechnical tests undertaken on samples obtained from the intrusive investigation is presented in Table 16. The results and UKAS accreditation of tests methods are shown in Appendix J.

Table 16 Summary of geotechnical testing undertaken

Strata	Tests undertaken	No. of tests
Atherfield Clay Formation / Weald Clay Formation	Moisture Content %	15
	Liquid/Plastic Limits %	15
	2.5kg Compaction	5
	California Bearing Ration (CBR) of a 4kg compacted sample (soaked)	5
	BRE suite pyritic geology	5

7.6.3 Infiltration testing

Infiltration tests were carried out in trial pits, TPS1 – TPS3 to establish the infiltration rate of the Weald Clay underlying the site. The tests were carried out generally in accordance with the method described in BRE Digest 365 (BRE, 2016). This involved filling the pits with water from a tanker and recording the drop in water level with time as the water soaked into the ground.

Copies of the testing records are included in Appendix G.

8 SITE INVESTIGATION FACTUAL FINDINGS

The results of the intrusive investigation and subsequent geo-environmental and geotechnical laboratory analysis undertaken are detailed below.

8.1 Ground conditions encountered

The descriptions of the strata encountered, notes regarding visual or olfactory evidence of contamination, list of samples taken, field observations of soil and groundwater, in-situ testing and details of monitoring well installations are included on the exploratory hole records presented in Appendix G.

The exploratory holes revealed that the site is underlain by a variable thickness of topsoil over either Atherfield or Weald Clay. This appears to confirm the stratigraphical succession described within the preliminary CSM, although it should be noted made ground was encountered at several locations where it was not expected.

For the purpose of discussion, the ground conditions encountered during the fieldworks are summarised in Table 17 with the strata discussed in subsequent subsections.

Table 17 General succession of strata encountered

Stratum	Exploratory holes encountered	Depth to top of stratum m bgl	Proven thickness (m)
Made ground	TP1, TP2,TP4, WS1 and TPS1	Ground level to 0.50m	0.3m to >3.0m (depth not proven in TP2)
Cultivated Topsoil	All except TP1, TP2, WS1, TPS1	Ground Level	0.2m to 0.4m
Weald Clay Formation	All	0.2m to 2.1m	2.8m (proven to maximum depth of investigation.

8.1.1 Made ground

The made ground encountered in TP1, TP2, WS1,TPS1 and beneath the topsoil in TP4. The unit generally comprised a gravelly silty sand with glass and brick fragments and ranged in thickness from 0.3m to 2.1m where proven. The depth of the made ground extended beyond the termination depth of 3.0m in TP2. The four locations where made ground was encountered are all in the south eastern portion of the site near to the access road. Made ground was encountered to a greater depth in TP2 and WS1, adjacent to the pond in the north east.

8.1.2 Cultivated Topsoil

Topsoil deposits encountered across the remainder of the site comprised a clay rich soil comprising soft brown silty clay with frequent rootlets, ranging in thickness between 0.2 m and 0.4 m.

8.1.3 Weald Clay Formation

These strata were encountered at a depth of between 0.2m and 2.1m below ground level and have been proven to extend beyond the maximum investigation depth of 3m, with a maximum thickness of 2.8m observed. These units comprised mostly cohesive strata, with granular siltstone and mudstone bands observed at depth.

A summary of the in-situ and laboratory test results recorded in the stratum are presented in Table 18.

Table 18 Summary of in-situ and laboratory test results for cohesive unit

Soil parameters	Min. Value	Max. Value	Reference
Moisture content (%)	17	32	Appendix J
Modified moisture content (%)	20	77	Appendix J
Liquid limit (%)	38	78	Appendix J
Plasticity limit (%)	20	31	Appendix J
Plasticity index (%)	18	47	Appendix J
Modified plasticity index (%)	9	46	Appendix J
Plasticity term	Intermediate	Very High	NA
Volume change potential	Low	High	NA
SPT 'N' values	4	50	Appendix G
Undrained shear strength inferred from SPT 'N' values (kN/m^2)*	17.2	215	Appendix G
Undrained shear strength measured by shear vane testing (kN/m^2)	28	87	Appendix G
Consistency term from field description	Soft	Very stiff	Appendix G
Strength term? (based on shear vane testing)	Low	High	Appendix G
Compaction results			
Maximum dry density	1.53	1.69	Appendix J
Optimum moisture content	14.1	20.8	Appendix J
Notes: *derived using a Stroud Factor of 4.3.			

8.1.4 Visual/olfactory evidence of soil contamination

The maximum recorded PID result was 0.4ppm recorded in WS01-ES03 at 1.2m. All other samples recorded PID results below the equipment limit of detection (<0.1ppm).

The majority of the site was underlain by a nominal thickness of topsoil and or made ground. Deeper made ground was identified in the vicinity of TP2 (>3.00m depth) and WS1 (2.10m depth). Based on anecdotal information provided by the land owner it is understood that this material originates from the excavation of the pond adjacent to the north eastern boundary of the site. The made ground in this location is described as gravelly clay containing varying amounts of anthropogenic material including brick, clinker, ceramic, glass, wood and gravel of flint and chalk. Decaying organic material was noted in TP02 from 1.80m to 3.00m.

8.2 Groundwater and surface water

8.2.1 Groundwater encountered during intrusive works

Water seepage were noted in TP02, TP06, TP11 and TPS01 at depths between 1.5m and 2.4m bgl. The remaining locations remained dry during the intrusive investigation.

8.2.2 Groundwater encountered during monitoring

Rest groundwater levels recorded during the monitoring programme are summarised in Table 19 based on the data provided in Appendix H.

Table 19 Summary of groundwater monitoring results

Monitoring well	Response zone depth (m)	TOC elevation (m AOD)	Depth to water (mb TOC)	Depth to base (m)	Notes
WS01	1.0 to 3.0	33.07	2.5	4.60	Water is thought to represent rainwater / perched water rather than a continuous waterbody.
			0.66		
			0.88		
WS02	1.0 to 3.5	28.23	2.90	3.45	
			0		
			0.09		
WS03	1.0 to 3.5	26.88	1.15	2.70	
			0.21		
			0.91		
WS04	2.0 to 4.0	26.88	DRY	3.50	
			0.16		
			0.34		
WS05	1.0 to 4.0	27.18	3.5	3.60	
			0.34		
			0.30		

8.3 Chemical laboratory results

The soil testing results are presented in Appendix I.

No asbestos was detected in soil screening.

8.4 Geotechnical laboratory results

The results of the geotechnical testing are discussed in Section 11 and presented in Appendix J.

8.5 Ground gas monitoring

The results of the ground gas monitoring and testing carried out are given in Appendix H and discussed in 9.4.

All three groundwater and ground gas monitoring rounds have been completed. A peak CO2 of 6.6 %/vol in WS1, peak Methane of <0.1%/vol and peak flow of 0.8 Litres a second were recorded in WS5.

It should be noted that the response zones of each well were flooded in all locations during rounds 2 and 3 which can lead to erroneous results.

9 GEO-ENVIRONMENTAL ASSESSMENT

9.1 Refinement of initial CSM

The published geological records of the area indicate that the site is underlain by Head deposits over both the Weald Clay Formation and the Atherfield Clay Formation. The investigation identified topsoil and or made ground overlying predominately cohesive units with occasional bands of granular material and occasional mudstone and siltstone bands at depth. Water seepage were noted in TP02, TP06, TP11 and TPS01 at depths between 1.5m and 2.4m bgl. The remaining locations remained dry during the intrusive investigation.

The initial CSM identified potential sources of ground contamination at the site associated with Made Ground. The investigation identified deeper made ground in the vicinity of TP01, TP02, TP4, TPS1 and WS01 ranging from 0.5mbgl to greater than 3.00m in TP02 where the full depth of made ground was not proven. The made ground in TP02 was noted to comprise slightly gravelly silty clay with occasional brick fragments, whole bricks, plastic, rare wood, cable, glass and decaying organic matter between 1.80mbgl to 3.00mbgl. The maximum recorded PID result was 0.4ppm recorded in WS01-ES03 at 1.2m. All other samples recorded PID results below the equipment limit of detection (<0.1ppm).

All three groundwater and ground gas monitoring rounds have been completed. A peak CO2 of 6.6 %/vol in WS1, peak Methane of <0.1%/vol and peak flow of 0.8 Litres a second were recorded in WS5.

The information and results gathered from the preliminary risk assessment and ground investigation undertaken at the site to date generally confirms the initial CSM. Notwithstanding the above the slightly elevated CO2 readings recorded in WS1 suggests the possibility of ground gas risk which will be discussed in Section 9.4.

9.2 Linkages for assessment

As described in LCRM (Environment Agency, 2021), there are two stages of quantitative risk assessment (QRA), Tier 2 generic (GQRA) and Tier 3 detailed (DQRA). The GQRA comprises the comparison of soil, groundwater, soil gas and / or ground gas results with generic assessment criteria (GAC) that are appropriate to the linkage being assessed. This comparison can be undertaken directly against the laboratory results or following statistical analysis depending upon the sampling procedure that was adopted. This assessment relates to LCRM Stage 1, Tier 2 generic quantitative risk assessment

Following the refinement of the CSM, the potentially complete contaminant linkages that require further assessment and the methodology of assessment are presented in Table 20.

Table 20 Linkages for GQRA

Potentially relevant contaminant linkage	Assessment method
Human health and phytotoxic-related linkages	
H1. Oral, dermal and inhalation exposure with impacted soil, soil vapour and dust by future residents	Human health GAC in Appendix K for a proposed residential end use with home-grown produce since the proposed end use includes residential gardens.
H2. Inhalation exposure of future residents to asbestos fibres	Qualitative assessment based on the asbestos minerals present, their form, concentration, location and the nature of the proposed development.
H3. Uptake of contaminants by vegetation potentially impacting plant growth (phytotoxicity)	Comparison of soil data to GAC in Appendix L for phytotoxicity.
H4. Organic contaminants permeating potable water supply pipes	Comparison of soil data to GAC in Appendix M for plastic water supply pipes using UKWIR (2010) guidance.
Controlled waters-related linkages	
W1. Leaching of soil contaminants and dissolved phase migration to wider principal/secondary aquifer* - undifferentiated aquifer relating to the aforementioned head deposits. - Running parallel with the northern boundary of the site is a strip of land underlain by a secondary A aquifer relating to the Weald Clay Formation sandstone. W2. Migration of dissolved phase contaminants to surface waters (tributary to Lancing Brook))	Since no surface water, groundwater or leachate data is available the potential for leaching of contaminants to groundwater of overland flow into surface water has been considered qualitatively using soil chemical results.
Ground gas-related linkages	
G1. Concentrations of methane and carbon dioxide in ground gas entering and accumulating in enclosed spaces or small rooms in new buildings, which could affect future site users. For methane this could create a potentially explosive atmosphere, while death by asphyxiation could result from carbon dioxide.	Borehole hazardous gas flow rates (Qhg) have been calculated using maximum (peak) methane and carbon dioxide concentrations and steady state flow rates in accordance with BS8485. This is subject to interpretation and use of professional judgement to designate the site or zones of the site characteristic situation by comparison to a Gas Screening Value (GSV) as appropriate and in line with the CSM.

9.3 Methodology and assessment of human health and phytotoxic-related linkages

9.3.1 H1. Oral, dermal and inhalation exposure with impacted soil by future occupants/site users

In order to assess the soil results against the appropriate GAC, the soil results have been split into appropriate data sets relevant to the oral, dermal and inhalation linkage.

As an initial assessment of each dataset, all soil results in each dataset have been directly compared against the GAC for residential with home-grown produce. These values are considered most appropriate given the proposed end use. The GAC for human health (together with details of their derivation) used in this assessment are included in Appendix K

The soil samples were tested for a range of potential contaminants, including metals, petroleum hydrocarbons (TPH), speciated polycyclic aromatic hydrocarbons (PAH), herbicides and pesticides.

Of the 12no. samples submitted for metals (As, Cd, Cr, Cu, Hg, Pb, Ni, Se, Zn), lead concentrations in made ground samples from TP02 at 0.30mbgl (360mg/kg) and WS01 at 0.20mbgl (252mg/kg) exceeded the GAC of 200mg/kg. Notwithstanding the above under the proposed development this area is likely to be public open space (POS) and the results do not exceed the GAC for POS. Therefore the above should be considered a conservative approach.

In regard to speciated PAH compounds 12no samples were submitted for chemical testing, with the exception of TP02 at 0.30mbgl and WS01 at 0.20mbgl chemical test results were below the laboratory limits of detection (LLD). While PAH compounds were recorded above the LLD in both these samples none exceeded the GAC.

In total six samples were submitted for speciated TPH and one sample for total TPH. Total TPH concentrations above the LLD were found in two samples including TP1 (0.0m to 0.3m) and WS01 (0.60m) with concentrations of 145mg/kg and 60mg/kg respectively. Where identified these appear to be within the aliphatic/aromatic C16 to C40 range, indicative of ‘heavy fuel oils’ and PAHs. No evidence of fuel oils was encountered during the site investigation. While TPH compounds were recorded above the LLD in both these samples none exceeded the GAC.

Three samples were submitted for a suite of organochlorine pesticides, organophosphorous pesticides and Triazine herbicides from across the site at shallow depth including TP3 (ground level to 0.20mbgl), TP6 (ground level to 0.20mbgl), TP11 (ground level to 0.10mbgl). All were found to be at concentrations below LLD suggesting that historical herbicide and pesticide use on site has not caused significant contamination.

The chemical test results indicate that with the exception of the deeper made ground in the vicinity of TP2 and WS1, no potentially significant risks associated with the soil contamination have been identified and it is considered that the site may be regarded as suitable for the proposed end use.

In regard to the made ground within TP2 and WS1 this material would be chemically and physically unsuitable based on the test results and presence of anthropogenic material including brick, glass, plastic for use in private gardens. Based on the proposed development plans this area will remain public open space (POS). The chemical results do not exceed the GAC for POS therefore at this stage no remediation would be required. Notwithstanding the above, given the limited number of exploratory locations completed as wells as the heterogeneity of materials encountered and anecdotal evidence regarding material provenance, the potential for previously unforeseen ground conditions remains. On this basis, it would be prudent to supplement existing data with a shallow exploratory works (hand pitting exercise) to accurately defined prevailing shallow ground conditions and soil suitability.

9.3.2 H2. Inhalation exposure of future occupants/site users to asbestos fibres

The visual inspection at the laboratory identified no materials suspected of potentially containing asbestos and the scheduled laboratory screening for asbestos found no detectable asbestos fibres within the samples of made ground or topsoil across the site.

9.3.3 H3. Uptake of contaminants by vegetation potentially inhibiting plant growth (phytotoxicity)

As for the human health assessment above, samples from the Made Ground have been used to undertake a statistical analysis for the phytotoxic metals zinc, copper, nickel, lead, cadmium and mercury.

Comparison of the recorded values to the GAC presented in Appendix L for this linkage indicates that the Made Ground in the vicinity of WS1 and TP2 contains concentrations of lead above the GAC (300mg/kg) therefore a relevant contaminant linkage may associated with phytotoxic effects. Notwithstanding visual inspection of vegetation at this location and across the site has not indicated signs of vegetative distress.

All other samples were found to be below the relevant GAC.

The above indicates that a pollutant linkage is unlikely to exist outside areas of deeper made ground. The made ground in the vicinity of WS1 and TP2 is unlikely to be a suitable medium for future planting.

9.3.4 H4. Organic contaminants permeating potable water supply pipes

For initial assessment purposes, the results of the investigation have been compared with the GAC presented in Appendix M for this linkage, which are reproduced from *UKWIR Report 10/WM/03/21. Guidance for the Selection of Water Supply Pipes to be used in Brownfield Sites* (UKWIR, 2010).

The results indicate that a relevant linkage is unlikely to exist associated with organic contaminants and therefore pollutant polyethylene (PE) and/or polyvinyl chloride (PVC) water supply pipes are expected to be suitable for use on the development.

It should be noted that at the time of this investigation the future routes of water supply pipes had not been established, hence the investigation and sampling strategy may not be fully compliant with UKWIR recommendations. Consequently, a targeted investigation and specific sampling/analytical strategy may be required at a later date once the route(s)

of the supply pipe(s) are known. It has been assumed that future potable water supplies lines will not traverse areas of deeper made ground identified in the vicinity of WS1 and TP2.

In addition, it is recommended that the relevant water supply company be contacted at an early stage to confirm its requirements for assessment, which may not necessarily be the same as those recommended by UKWIR.

9.3.5 W1 Leaching of soil contaminants and dissolved phase migration to wider principal/ secondary aquifer* / Migration of dissolved phase contaminants to surface waters

With the exception of the deeper made ground in the vicinity of TP2 and WS1 all soil samples submitted for analysis were found to below the corresponding Generic Assessment Criteria (GAC) in regard to human health, phytotoxicity and potable water supply pipes. Based on this assessment and observations of the made ground and cohesive natural soils made during the site investigation no potentially significant risks associated with the migration of dissolved phase contaminants to the wider Secondary A aquifer have been identified.

9.4 G1: Methodology and assessment of ground gas-related linkages

9.4.1 Appropriate guidance

The risks to development from ground gases have been assessed in accordance with BS8485:2015+A1:2019 (BS8485), which provides guidance on ground gas (methane and carbon dioxide) characterisation and hazard assessment, as well as providing a framework for the prescription of protection measures within new buildings.

The process involves characterising the gas hazard from combining the qualitative assessment of risk (using the CSM) with ground investigation data so that a 'characteristic situation' (CS) can be derived for the site or zones within the site. Characteristic situations range from CS1 to CS6, the higher the CS, the higher the hazard potential. Gas protection measures within new buildings can be prescribed using a point scoring system, taking into consideration the CS and the proposed building type.

BS8485 indicates that the gas hazard can be characterised using the following methods:

- an empirical semi-quantitative approach using gas monitoring data to determine the 'characteristic situation' of the site (or zones of the site) and subsequent protective measures (Wilson and Card approach).
- an empirical semi-quantitative approach using TOC data to determine the 'characteristic situation' of the site (or zones of the site) and subsequent protective measures (CL:AIRE RB17 approach) or
- detailed quantitative assessment methodologies.

For the purpose of this assessment, the empirical semi-quantitative approach above has been used to characterise the gas hazard and provide advice on the protective measures likely to be required within new buildings at the site.

9.4.2 Empirical semi-quantitative approach using borehole monitoring data

The empirical semi quantitative approach using gas monitoring data requires the designation of a gas screening value (GSV) for the entire site or zones within the site, which informs the hazard potential and associated prescribed ground gas protection measures within new buildings (where necessary). BS8485 defines the GSV as the *'flow rate (l/hr) of a specific hazardous gas* ***representative of a site or zone****, derived from assessment of borehole concentration and flow rate measurements and taking account of all other influencing factors, in accordance with a conceptual site model'.*

BS8485 Section 6.3.1 outlines the process for developing a GSV for the site or a zone as follows:

- Borehole hazardous gas flow rate (Q_{hg}) is calculated for each borehole standpipe for each monitoring event. The borehole hazardous gas flow rate is defined in BS8485 as the '*flow rate of a specific hazardous gas, either methane or carbon dioxide, from a borehole standpipe'*. The Q_{hg} is calculated from individual borehole measurements of total gas flow and the concentration of the specific hazardous gas. BS8485 states in Section 6.3.4 that the **maximum** gas concentration recorded during the monitoring event should be used, together with **steady-state** values of gas flows;
- The reliability of the measured gas flow rates and concentrations are assessed taking into account borehole construction;
- Decisions are made about how to deal with any temporal or spatial shortages in the data; and
- Judgements are made about what GSV to designate for use for design purposes taking all relevant information and the conceptual site model into account.

Once the Q_{hg} has been calculated for methane and carbon dioxide, individual borehole measurements are compared to the thresholds presented in Table 2 of BS8485 which inform the CS that directly relates to each individual measurement. Taking into account the site data (i.e. borehole gas concentration and flow rate to calculate the Q_{hg}) and all other influencing factors in accordance with the CSM, a decision can then be made regarding the GSV that is considered to be representative of the site or a zone within it.

Typical threshold concentrations of methane (1% v/v) and carbon dioxide (5% v/v), and flow rates (>70 l/h), are also considered when designating the GSV for the site or zone, which in turn dictates the hazard potential and CS. It is important to note that the site or zone characteristic GSV and maximum concentration or flow thresholds are guideline values and not absolute. The thresholds may be exceeded in certain circumstances, if the CSM indicates it is safe to do so.

The results of the ground gas monitoring and testing undertaken, alongside site conditions at the time of monitoring, are given in Appendix H.

A summary of the maximum recorded concentrations per borehole (or minimum for oxygen) is presented in **Table 21** overleaf. This table also presents details of the response zone, maximum recorded initial and steady state flow rates and minimum recorded depth to water across all monitoring rounds.

The range of atmospheric pressure over the monitoring rounds was 992 to 1030mbar.

Table 21 Summary of ground gas monitoring results all data/ excluding entirely flooded response zones*

Exploratory position ID	Response zone (mbgl)	Response zone geological unit	monitoring round	monitoring round date	Peak CH_4 max. (%/vol)	Steady-state CH_4 max. (%/vol)	Peak CO_2 max. (%/vol)	Steady-state CO_2 max. (%/vol)	Oxygen min. (%/vol)	Peak gas flow max. (l/hr)	Steady-state gas flow max. (l/hr)	Atm. pressure (mb)
WS1	0.60 to 4.00	Natural and Made ground	1	1/12/2021	<0.1	<0.1	6.6	-	17.1	0.0	0.0	998 to 997

			3	15/12/2021	<0.1	<0.1	0.5	0.1	21.0	0.4	0.0	1030
WS2	0.45 to 3.45	Natural	1	1/12/2021	<0.1	<0.1	0.4	0.4	21.3	0.0	0.0	998 to 997
			2	8/12/2021	<0.1	<0.1	0.3	-	21.0	0.0	0.0	992 to 993
			3	15/12/2021	<0.1	<0.1	0.1	0.1	21.0	0.0	0.0	1030
WS3	0.37 to 2.70	Natural	1	1/12/2021	<0.1	<0.1	1.2	1.2	20.3	0.0	0.0	998 to 997
			2	8/12/2021	<0.1	<0.1	0.2	0.1	21.1	0.0	0.0	992 to 993
			3	15/12/2021	<0.1	<0.1	1.0	0.7	18.9	0.5	0.0	1030
WS4	1.45 to 3.45	Natural	1	1/12/2021	<0.1	<0.1	1.3	1.3	20.5	0.0	0.0	998 to 997
			2	8/12/2021	<0.1	<0.1	0.2	0.1	21.0	0.0	0.0	992 to 993
			3	15/12/2021	<0.1	<0.1	0.1	0.1	20.8	0.6	0.0	1030
WS5	0.45 to 3.45	Natural	1	1/12/2021	<0.1	<0.1	0.2	0.2	21.2	0.0	0.0	998 to 997
			2	8/12/2021	<0.1	<0.1	0.2	0.1	21.1	0.0	0.0	992 to 993
			3	15/12/2021	<0.1	<0.1	0.1	0.1	21.0	0.8	0.0	1030

A peak CO2 of 6.6 %/vol in WS1 during round 1, peak Methane of <0.1%/vol and peak flow of 0.8 Litres a second were recorded in WS5 during round 3.

It should be noted that the response zones of each well were flooded in all locations during rounds 2 and 3 which can lead to erroneous results.

Therefore a peak CO2 of 6.6 %/vol, peak Methane of <0.1%/vol and peak flow of <0.1 Litres a second have been used to calculate.

In accordance with BS8485, a 'worst case' scenario has been calculated for the site by multiplying the maximum recorded flow from any monitoring round by the maximum recorded methane or carbon dioxide concentration.

The gas monitoring data has identified a maximum methane concentration of <0.1% and a maximum concentration of carbon dioxide of 6.6%. A maximum steady gas flow rate of 0.1 l/hr has been recorded. The calculated GSV for methane (based on limits of detection) is 0.0001 l/hr and for carbon dioxide is 0.066. Based on the GSVs alone the site would be classified as Characteristic Situation 1 (Very Low Risk).

However, based upon the maximum recorded concentrations of carbon dioxide, which exceed a provisional upper threshold of 5% for a Characteristic Situation 1 classification, a more robust monitoring data set would be required to adequately characterise the site. On this basis, the site classification should provisionally be increased to Characteristic Situation 2 until further monitoring has been undertaken to characterise the site.

Notwithstanding the above the risk is associated with deeper made ground on an area of the site that will be set aside as POS. In addition to this the made ground is raised above the rest of the site and is underlain by cohesive soils of the Warhurst Clay Formation. Based on the ground conditions, position of the waste, its elevation above the site and the results of the ground gas monitoring the risk posed by groundgas on site has been ruled out and no further assessment is required in terms of groundgas.

9.5 Uncertainties and implications in refined CSM and GQRA

In accordance with good practice, data gaps and uncertainties in the refined CSM have been identified at this stage. These are summarised in Table 22 along with the likely implications.

Table 22 Data gaps and uncertainties

Data gap/ uncertainty	Details	Implications
The area on the south west corner of the site was heavily vegetated and not accessible for investigation.	Under proposed development plans while this area lies within the site boundary it is not shown to be developed.	There is a gap in coverage for soil for this area. Notwithstanding the above the development plans available to RSK do not show development in this area so no further investigation is proposed at this stage.
Asbestos not found in made ground samples tested	Although not encountered to date, asbestos containing material (ACM) could still be present in discrete locations	Vigilance should be maintained for any potential ACM or fibrous material during below ground works especially in areas of deeper made ground (TP2 and WS1)
Only three rounds of ground gas monitoring has been completed to date. In addition the response zones during rounds 2 and 3 were flooded and therefore the data has been omitted from the ground gas assessment.	The worst case conditions for gas flow are unlikely to have been characterised, limiting the risk assessment.	The likely worst case gas regime has not been used and thus ground gas mitigation measures may be underestimated without further ground gas monitoring during a period of falling pressure
No groundwater and surface water samples were collected as part of the investigation	While water seepages were identified in a number of locations these are not thought to represent a continuous groundwater body rather perched water trapped in made ground / granular bands. Therefore it has not been possible to sample and test groundwater. Surface water sampling and testing of onsite surface water features was not included as part of the scope.	The initial risk to controlled waters and surface water has been based on soil chemical results rather than direct sampling of surface and or groundwater. Testing of surface water or groundwater samples would be a more robust assessment. Notwithstanding the above the risk to surface and controlled waters is deemed low based on the assessment undertaken and further sampling and testing is not recommended at this stage.

10 PRELIMINARY WASTE ASSESSMENT

In accordance with the definition provided in the Waste Framework Directive (WFD), materials are only considered waste if 'they are discarded, intended to be discarded or required to be discarded, by the holder'. Naturally occurring soils are not considered waste if reused on the site of origin for the purposes of development. Soils such as made ground that are not of clean and natural origin (irrespective of whether they are contaminated or not) and other materials such as recycled aggregate, do not become waste until the criteria above are met. Further background information is provided in Appendix F.

Excavation arisings from the development may therefore be classified as waste if surplus to requirements or unsuitable for reuse. The following assessments assume the material tested is classified subsequently as waste.

10.1 Hazardous waste assessment

Technical Guidance WM3 (EA, 2018) sets out in its Appendix D requirements for waste sampling. It is a legal requirement to correctly assess and classify waste. The level of sampling should be proportionate to the volume of waste and its heterogeneity. The preliminary assessment provided below is based only upon the available sample results and may not be sufficient to adequately classify the waste.

10.1.1 Chemical contaminants

Envirolab, an RSK company, has developed a waste soils characterisation assessment tool (HASWASTE), which follows the guidance within Technical Guidance WM3. The analytical results have been assessed using this tool to assess the hazardous properties to support potential off-site disposal of materials in the future. A copy of the assessment has been included in Appendix N. Note that it is ultimately for landfills to confirm what wastes they are able to accept within the constraints of their permit.

No samples were found to have hazardous properties based on this assessment. This suggests that if applicable the waste would require disposal at a suitably permitted inert or non-hazardous waste landfill.

10.1.2 Asbestos within waste soils

Technical Guidance WM3 requires that within a mixed waste the separately identifiable wastes be assessed separately.

For instance, where waste soil contains identifiable pieces of asbestos (visible to the naked eye) the asbestos should, where feasible, be separated from the soil and classified separately. This should be disposed of within a hazardous, stable non-reactive hazardous waste landfill or a special cell in a non-hazardous waste landfill.

As noted above the visual inspection on site and at the laboratory identified no materials suspected of potentially containing asbestos and the scheduled laboratory screening for asbestos found no detectable asbestos fibres within the samples of made ground or topsoil across the site. Notwithstanding the above asbestos containing materials may still be present in discrete areas of site and particular care and attention should be taken when excavating in areas of deeper made ground.

10.2 WAC assessment

A sample from 0.60mbgl in WS01 was submitted for waste acceptance criteria (WAC) testing, the results of which are presented in Appendix I.

The results of the WAC testing indicate that the leaching limit values for inert waste have been exceeded and therefore the waste is not suitable for disposal within an inert landfill but should be disposed of at a landfill or treatment facility which is permitted to take non-hazardous waste.

RSK recommends that a Sampling Plan be prepared to support any waste classifications and hazardous waste assessments, prior to any material being excavated. Given the level of data obtained, scale of the development and heterogeneity of the site soils, the following assessment should be considered indicative and further assessment should be undertaken following the preparation of a waste sampling plan.

11 GEOTECHNICAL ASSESSMENT

11.1 Proposed development

The proposed layout of the site, at the time of preparing this report, is shown in Appendix B. The proposed development comprises private residential homes with associated driveways, soft landscaping frontage and rear gardens, as well as areas of public open space and sports pitches. It has been assumed the ground-bearing floor slabs will not be required and that beam and block flooring will be utilised.

11.2 Key geotechnical hazards/development constraints

The key risks identified from the available ground investigation data are discussed below:

- presence of shrinkable clay soils associated with the weathered portion of Weald Clay Formation and Arthfield Clay;
- pyritic ground conditions associated with the underlying geology;
- lateral and vertical variable ground conditions;
- variable silt content associated with the underlying ground conditions;
- deep made ground in the vicinity of TP2 and WS1

11.3 Foundations

11.3.1 Foundation options

Given the presence of competent natural soils at a relatively shallow depth it is considered that traditional spread footings will be suitable for the proposed development.

Given the significant depth of made ground encountered in the vicinity of TP2 and WS1 spread footings are unlikely to be suitable for the development unless it is proposed to reduce the level of the site in this area as part of the proposed development.

The adoption of traditional spread foundations to support the predominantly low-rise residential development appears technically feasible. However, the deep made ground recorded to the south, together with locally low strength soils (inferred from in-situ test results and field descriptions) is likely to dictate the requirement for some of the proposed foundations to be significantly deepened. Furthermore, the presence of potentially desiccated clay soils in the vicinity of existing trees/hedges (notably to the west of the site densely populated with trees) may exist. The foundation design therefore needs to take account of the potential for damaging ground movements to occur as a result of shrinkage of the clay soils close to existing trees and the subsequent swelling where trees maybe be removed.

Whilst recommendations for the design and construction of spread foundation is provided in Section 11.3.2, it is recommended that further investigations be conducted to provide greater confidence that traditional spread foundations will prove economically viable given the likely requirement to locally deepen and support foundation excavations. Alternatively, prior treatment, such as vibro-compaction/replacement may prove a more cost effective

solution to enable the adoption of shallow foundations. However, it is recommended that advice be sought from a ground improvement specialist to confirm suitability of the ground conditions for treatment and achievable bearing capacities.

Notwithstanding the above, recourse to piled foundations could also be adopted, subject to further deeper investigations confirming design parameters.

11.3.2 Spread foundations

The recommendations for the design and construction of spread foundations in relation to the ground conditions are set out in Table 23.

Table 23 Design and construction of spread foundations

Design/construction considerations	Design/construction recommendations
Founding stratum	Weald Clay Formation
Depth	Foundations should be taken to a minimum depth of 1.0m below the final or existing ground level, whichever is lower, and at least 0.2m into the founding stratum below any overlying made ground or to any greater depth required in respect of the special design considerations given below.
Special design considerations	
Shrinkable soils	Owing to the presence of shrinkable clay soils, foundations should be designed taking into account all the normal precautions, including minimum founding depths, to minimise the risk of future foundation movements in accordance with NHBC standards or similar. The findings of the ground investigation indicate that foundations should be designed for shrinkable soils of low to high volume change potential.
Presumed bearing capacity	Strip/trench fill foundations with a width of upto 1.0m and constructed on the firm to stiff clay at a minimum depth of 1.0m may be designed using a presumed bearing capacity of 90 kN/m^2. The presumed bearing capacity includes a partial factor on bearing resistance of 3 against bearing capacity failure. Total settlements associated with the presumed bearing pressure are anticipated to be less than 25 mm.
Construction considerations	All foundation excavations should be inspected, and any made ground and soft, organic or otherwise unsuitable materials removed and replaced with mass concrete. The proposed founding stratum is a relatively silt-rich soil, hence susceptible to rapid softening once exposed. Hence all foundation excavations should immediately be blinded with concrete or the full foundation constructed.

11.4 Roads and hardstanding

In the 1 m to 1.5 m below the proposed finished ground level the exploratory holes have revealed a soil profile comprising topsoil and or mage ground overlying initially soft

becoming firm to stiff clay. The potentially poorest sub-grade material within this profile is the made ground.

In pavement design terms, the groundwater conditions are anticipated to comprise a low water table, i.e. at least 1 m below the pavement formation level.

The estimated minimum, equilibrium soil-suction, California bearing ratio (CBR) value for the soils and groundwater conditions described above under a completed pavement is 2 %, based upon Table C1 in TRRL (1984) Report LR1132.

The results of in-situ testing are summarised in Table 24.

Table 24 Summary of CBR values derived from in-situ and ex-situ methods

Test location	Material type	Minimum CBR value determined at or just below anticipated formation level
Laboratory test in line with BS1337:4 clause 7 (seating 10N and surcharge 4kg)		
HP01 0.40-0.60m	Yellowish brown slightly sandy CLAY with roots	2.8 % to 5.8 %
HP02 0.50m	Yellowish brown mottled dark brown slightly sandy CLAY.	3.7% to 4.9%
HP03 0.50m	Yellowish brown mottled grey slightly sandy CLAY.	2.3% to 3.5%
HP04 0.50m	Greyish brown slightly sandy CLAY.	1.2% to 1.6%
HP05 0.50-0.60	Yellowish brown slightly sandy CLAY with rare gravel. Gravel is fine to medium.	2.4% to 3.2%
In-Situ Dynamic Cone Penetrometer		
DCP1 (0.50) to DCP10 (0.50)	NA	3% to 10%

The recommended sub-grade soil CBR value for road pavement design is therefore 3 %. This value assumes that during construction the formation level will be carefully compacted and any soft spots removed and replaced with well-compacted granular fill.

The sub-grade soils can be regarded as potentially frost-susceptible, based upon the criteria given in Appendix 1 of TRRL (1970) Report Road Note 29. When the sub-grade is frost-susceptible the thickness of sub-base must be sufficient to give a total thickness of non-frost-susceptible pavement construction over the soil of not less than 450 mm.

11.5 Excavations for foundations and services

Generally, the trial pits remained stable during excavation which indicates that foundation excavations should also remain stable in the short term. In the event that excavations are to remain open for longer periods, consideration should be given to the use of trench support systems.

Man entry into any excavations should not be undertaken without provision of suitable shoring and support and dewatering or suitable regrading and battering of side slopes to safe angles. Confined spaces protocols for the Health and Safety of personnel should always be used where man entry into excavations is to be undertaken as low oxygen conditions may be present.

Groundwater was encountered at 1.5m in TPS1 and 2.0m in TP2. Notwithstanding the above the recommendations are expected to remain relatively dry in the short term and dewatering is not thought to be required unless pits unless excavations are likely to remain open.

The cohesive nature of the soils encountered suggests that pumping from open sumps if required should be sufficient to keep the excavations reasonably dry.

11.6 Chemical attack on buried concrete

This assessment of the potential for chemical attack on buried concrete at the site is based on BRE Special Digest 1: Concrete in aggressive ground, which represents the most up-to-date guidance on this topic currently available in the UK.

The desk study and site reconnaissance indicate that, for the purposes of assessing the aggressive chemical environment of the site, the site should be considered as comprising natural ground and some made ground likely to contain pyrite.

Based on testing results, Table 25 gives the characteristic pH, water-soluble and total sulphate content values for soils from each of the geological units and groundwater encountered on-site.

The two samples of made ground taken from 0.20m and 1.20m have been excluded from the assessment. This area under the proposed development is POS and therefore the made ground in this location will not come into contact with foundations.

Table 25 Characteristic pH, water soluble sulphate and total sulphate values

Stratum	pH	Water Soluble Sulphate (mg/l)	Total Potential Sulphate (mg/l)
Cultivated topsoil	6.6 to 7.2	10 to 55	0.06 to 0.09
Weald Clay Formation	6.06 to 8.21	<10 to 481	0.03 to 0.18

Based on the results above and following the steps outlined in the BRE guidance, the Design Sulphate Classes and Aggressive Chemical Environment for Concrete classifications are summarised in Table 26, on the basis of water soluble sulphate and total potential sulphate, respectively.

Table 26 Concrete design class

Stratum	Ground water	Water Soluble Sulphate		Total Potential Sulphate	
		DS Class	AC Class	DS Class	AC Class
Cultivated topsoil	Static	DS-1	AC-1s	DS-1	AC-1s
Weald Clay Formation	Static	DS-1	AC-1s	DS-1	AC-1s

From consideration of results for pyritic, Design Sulphate Class of DS-1, may be adopted for the site. It has been assumed that groundwater conditions are static. From consideration of the characteristic pH value, an Aggressive Chemical Environment for Concrete classification of AC-1s may be assumed for design purposes.

11.7 Infiltration drainage

Soakage testing was carried out in general accordance with BRE 365 within four of the trial pits, designated TPS1, TPS2 and TPS3. However due to the slow infiltration, the tests were carried out only once at each location, rather than the three times prescribed within BRE 365. Further, the slow soakage dictated that infiltration rates for all of the exploratory holes could not be determined between the full 75% and 25% range of the effective depth as suggested in BRE 365. Therefore the low permeability clays encountered at shallow depth do not appear suitable for the discharge of surface waters via traditional chamber soakaways. However consideration may be given to alternatives, such as sustainable urban drainage systems.

12 CONCLUSIONS AND RECOMMENDATIONS

12.1 Environmental

As an initial assessment of each dataset, all soil results in each dataset have been directly compared against the GAC for residential with home-grown produce.

The chemical test results indicate that with the exception of the deeper made ground in the vicinity of TP2 and WS1, no potentially significant risks associated with the soil contamination have been identified and it is considered that the site may be regarded as suitable for the proposed end use.

In regard to the made ground within TP2 and WS1 this material would be chemically and physically unsuitable based on the test results and presence of anthropogenic material including brick, glass, plastic for use in private gardens. Based on the proposed development plans this area will remain public open space (POS). The chemical results do not exceed the GAC for POS therefore at this stage no remediation would be required. Notwithstanding the above, given the limited number of exploratory locations completed as wells as the heterogeneity of materials encountered and anecdotal evidence regarding material provenance, the potential for previously unforeseen ground conditions remains. On this basis, it would be prudent to supplement existing data with a shallow exploratory works (hand pitting exercise) to accurately defined prevailing shallow ground conditions and soil suitability.

While ACM were not encountered during the investigation the presence of discrete asbestos fragments cannot be ruled out and may be encountered during more extensive groundworks within the made ground on site. Vigilance should be maintained for any potential ACM or fibrous material during below ground works.

A pollutant linkage is unlikely to exist in regards to phytotoxicity outside areas of deeper made ground. The made ground in the vicinity of WS1 and TP2 is unlikely to be a suitable medium for future planting.

The results indicate that a relevant linkage is unlikely to exist associated with organic contaminants and therefore pollutant polyethylene (PE) and/or polyvinyl chloride (PVC) water supply pipes are expected to be suitable for use on the development. It has been assumed at this stage that groundwater supply pipes would not be placed in areas of deep made ground.

Based on chemical test results and the soil and groundwater conditions encountered no potentially significant risks associated with the migration of dissolved phase contaminants to the wider Secondary A aquifer have been identified.

Three rounds of ground gas monitoring has been conducted to date which has locally receded elevated concentrations of carbon dioxide above the 5% threshold suggested for a very low risk Characteristic Situation 1 regime. Notwithstanding the above based on the ground conditions, position of the waste, its elevation above the site and the results of the ground gas monitoring the risk posed by groundgas has been discounted and the site can be classified as Characteristic Situation 1 for which no gas protection measures are required.

Results of the preliminary waste classification suggest made ground soils unlikely to be considered inert based on current understanding of physical constituents as well as preliminary WAC data.

Should ground conditions of concern be encountered during site development then appropriate advice must be sought from a geo-environmental consultant.

12.2 Geotechnical

Given the presence of competent natural soils at a relatively shallow depth, it is considered that spread foundations are suitable for the proposed development. Locally recourse to piled foundations may more economical where foundations need to be deepened for tree influence in line with NHBC guidance for building in cohesive soils with a high volume change potential. Should a piled foundation solution be required, then additional boreholes will be required to determine the parameters for piled foundation design.

The recommended sub-grade soil CBR value for preliminary road pavement design is 2%. The sub-grade soils can be regarded as frost-susceptible. When the sub-grade is frost-susceptible the thickness of sub-base must be sufficient to give a total thickness of non-frost-susceptible pavement construction over the soil of not less than 450 mm.

It is recommended that buried concrete for spread foundations is designed in accordance with Design Sulphate Class DS-1 and Aggressive Chemical Environment for Concrete Class AC-1s.

Excavations within the cohesive units should remain stable during construction, but some localised dewatering/pumping and shoring may be required where shallow granular material was identified.

The ground conditions do not appear to be suitable for the use of pit soakaways.

12.3 Recommendations:

It is recommended that additional investigation to delineate the extent as well as the chemical and physical composition of the deep made ground identified in the vicinity of TP2 and WS1 be undertaken including:

- Shallow hand dug pits
- Chemical testing to refine suitability assessment and waste characterisation

APPENDICES

APPENDIX A
SERVICE CONSTRAINTS

1. This report and the site investigation carried out in connection with the report (together the "Services") were compiled and carried out by RSK Environment Limited (RSK) for Bellway Homes Ltd (the "Client") in accordance with the terms of a contract RSK Environment Standard Terms and Conditions between RSK and the Client.. The Services were performed by RSK with the reasonable skill and care ordinarily exercised by an environmental consultant at the time the Services were performed. Further, and in particular, the Services were performed by RSK taking into account the limits of the scope of works required by the client, the time scale involved and the resources, including financial and manpower resources, agreed between RSK and the Client.
2. Other than that, expressly contained in paragraph 1 above, RSK provides no other representation or warranty whether express or implied, in relation to the Services.
3. Unless otherwise agreed in writing, the Services were performed by RSK exclusively for the purposes of the Client. RSK is not aware of any interest of or reliance by any party other than the Client in or on the Services. Unless expressly provided in writing, RSK does not authorise, consent or condone any party other than the client relying upon the Services. Should this report or any part of this report, or otherwise details of the Services or any part of the Services be made known to any such party, and such party relies thereon that party does so wholly at its own and sole risk and RSK disclaims any liability to such parties. **Any such party would be well advised to seek independent advice from a competent environmental consultant and/or lawyer.**
4. It is RSK's understanding that this report is to be used for the purpose described in the introduction to the report. That purpose was a significant factor in determining the scope and level of the Services. Should the purpose for which the report is used, or the proposed use of the site change, this report may no longer be valid and any further use of or reliance upon the report in those circumstances by the client without RSK 's review and advice shall be at the client's sole and own risk. Should RSK be requested to review the report after the date of this report, RSK shall be entitled to additional payment at the then existing rates or such other terms as agreed between RSK and the client.
5. The passage of time may result in changes in site conditions, regulatory or other legal provisions, technology or economic conditions which could render the report inaccurate or unreliable. The information and conclusions contained in this report should not be relied upon in the future without the written advice of RSK. In the absence of such written advice of RSK, reliance on the report in the future shall be at the Client's own and sole risk. Should RSK be requested to review the report in the future, RSK shall be entitled to additional payment at the then existing rate or such other terms as may be agreed between RSK and the client.
6. The observations and conclusions described in this report are based solely upon the Services which were provided pursuant to the agreement between the Client and RSK. RSK has not performed any observations, investigations, studies or testing not specifically set out or required by the contract between the client and RSK. RSK is not liable for the existence of any condition, the discovery of which would require performance of services not otherwise contained in the Services. For the avoidance of doubt, unless otherwise expressly referred to in the introduction to this report, RSK did not seek to evaluate the presence on or off site of asbestos, invasive plants, electromagnetic fields, lead paint, heavy metals, radon gas, persistent, bioaccumulative or toxic chemicals (including PFAS/ PFOS) or other radioactive or hazardous materials, unless specifically identified in the Services.
7. The Services are based upon RSK's observations of existing physical conditions at the Site gained from a visual inspection of the site together with RSK's interpretation of information, including documentation, obtained from third parties and from the Client on the history and usage of the site, unless specifically identified in the Services or accreditation system (such as UKAS ISO 17020:2012 clause 7.1.6):
    a. The Services were based on information and/or analysis provided by independent testing and information services or laboratories upon which RSK was reasonably entitled to rely.

b. The Services were limited by the accuracy of the information, including documentation, reviewed by RSK and the observations possible at the time of the visual inspection.

c. The Services did not attempt to independently verify the accuracy or completeness of information, documentation or materials received from the client or third parties, including laboratories and information services, during the performance of the Services.

RSK is not liable for any inaccurate information or conclusions, the discovery of which inaccuracies required the doing of any act including the gathering of any information which was not reasonably available to RSK and including the doing of any independent investigation of the information provided to RSK save as otherwise provided in the terms of the contract between the Client and RSK.

8. The intrusive environmental site investigation aspects of the Services are a limited sampling of the site at pre-determined locations based on the known historic / operational configuration of the site. The conclusions given in this report are based on information gathered at the specific test locations and can only be extrapolated to an undefined limited area around those locations. The extent of the limited area depends on the properties of the materials adjacent and local conditions, together with the position of any current structures and underground utilities and facilities, and natural and other activities on site. In addition, chemical analysis was carried out for a limited number of parameters (as stipulated in the scope between the client and RSK, based on an understanding of the available operational and historical information) and it should not be inferred that other chemical species are not present.

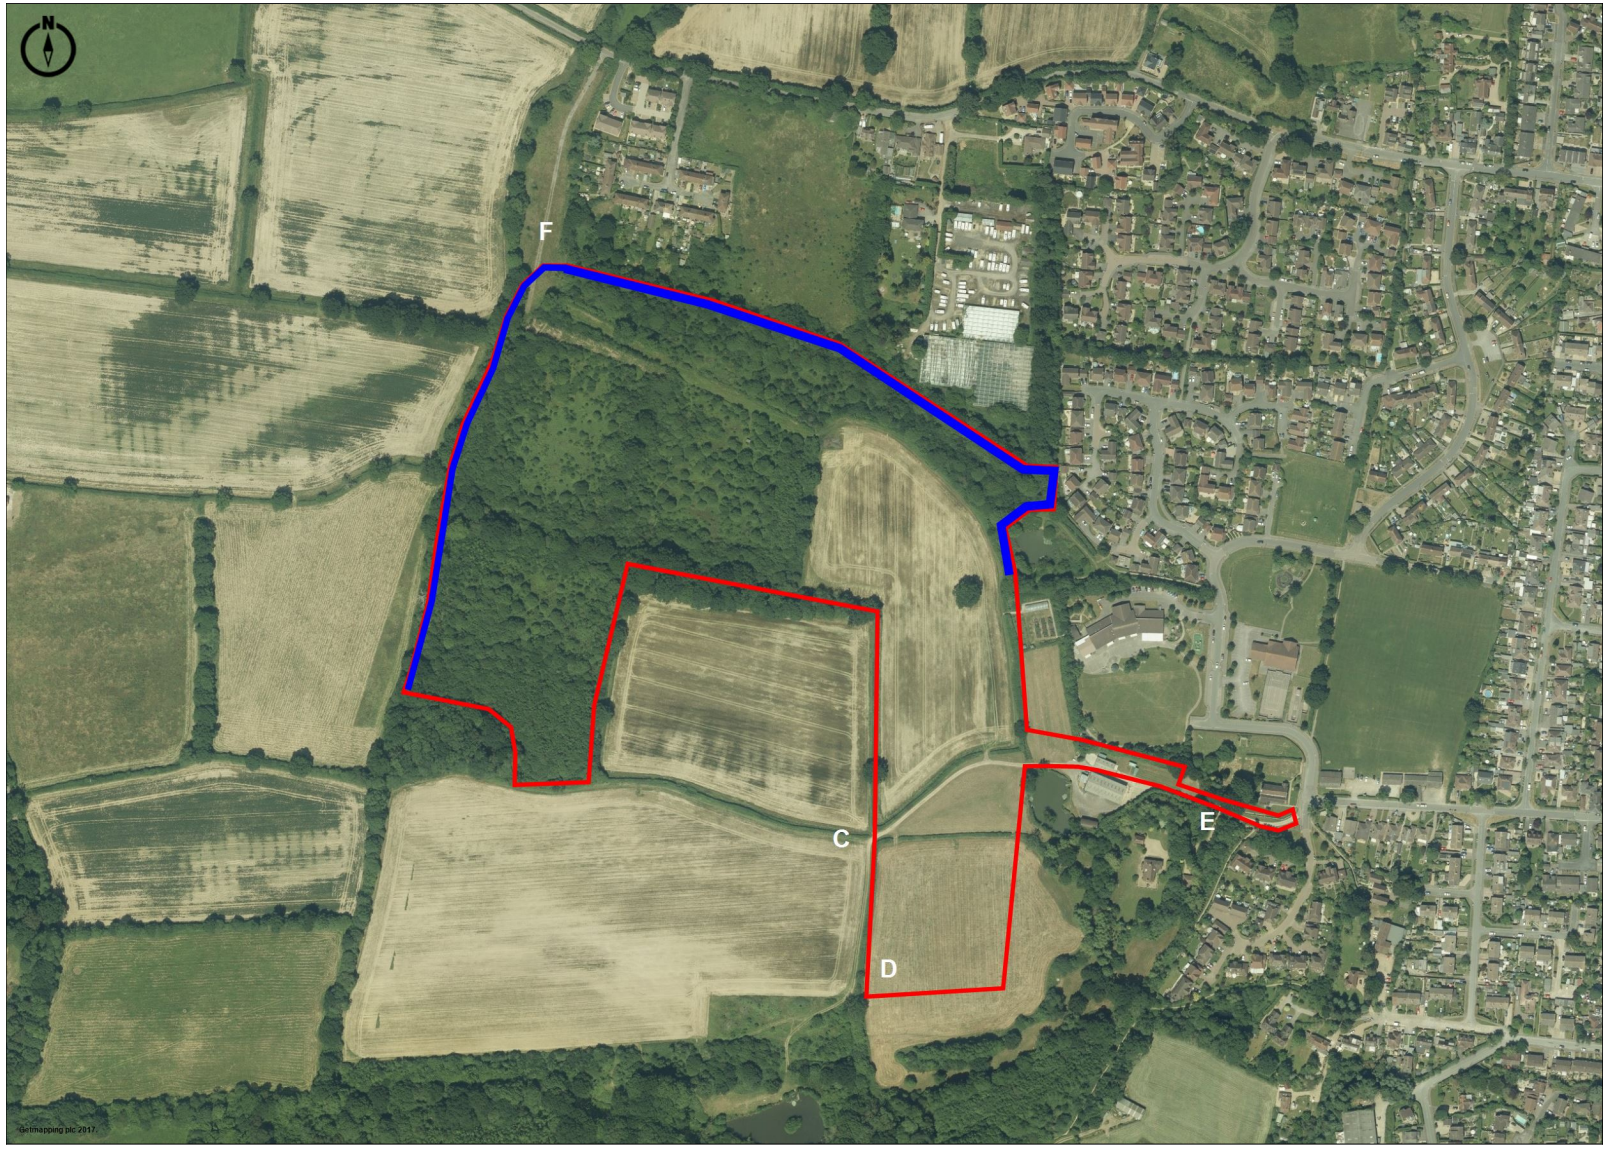

9. Any site drawing(s) provided in this report is (are) not meant to be an accurate base plan but is (are) used to present the general relative locations of features on, and surrounding, the site. Features (intrusive and sample locations etc) annotated on site plans are not drawn to scale but are centred over the approximate location. Such features should not be used for setting out and should be considered indicative only.

10. The comments given in this report and the opinions expressed are based on the ground conditions encountered during the site work and on the results of tests made in the field and in the laboratory. However, there may be conditions pertaining to the site that have not been disclosed by the investigation and therefore could not be taken into account. In particular, it should be noted that there may be areas of made ground not detected due to the limited nature of the investigation or the thickness and quality of made ground across the site may be variable. In addition, groundwater levels and ground gas concentrations and flows, may vary from those reported due to seasonal, or other, effects and the limitations stated in the data should be recognised.

11. Asbestos is often observed to be present in soils in discrete areas. Whilst asbestos-containing materials may have been locally encountered during the fieldworks or supporting laboratory analysis, the history of brownfield and demolition sites indicates that asbestos fibres may be present more widely in soils and aggregates, which could be encountered during more extensive ground works.

12. Unless stated otherwise, only preliminary geotechnical recommendations are presented in this report and these should be verified in a Geotechnical Design Report, once proposed construction and structural design proposals are confirmed.

APPENDIX C
SUMMARY OF LEGISLATION AND POLICY RELATING TO LAND CONTAMINATION

Part IIA of the Environmental Protection Act 1990

Part IIA of the Environmental Protection Act 1990 (Part IIA) and its associated Contaminated Land Regulations 2000 (SI 2000/227), which came into force in England on 1 April 2000, formed the basis for the current regulatory framework and the statutory regime for the identification and remediation of contaminated land. Part IIA of the EPA 1990 defines contaminated land as 'any land which appears to the Local Authority in whose area it is situated to be in such a condition by reason of substances in, on or under the land, that significant harm is being caused, or that there is significant possibility of significant harm being caused, or that pollution of controlled waters is being or is likely to be caused'. Controlled waters are considered to include all groundwater, inland waters and estuaries.

In August 2006, the Contaminated Land (England) Regulations 2006 (SI 2006/1380) were implemented, which extended the statutory regime to include Part IIA of the EPA as originally introduced on 1 April 2000, together with changes intended chiefly to address land that is contaminated by virtue of radioactivity. These have been replaced subsequently by the Contaminated Land (England) (Amendment) Regulations 2012, which now exclude land that is contaminated by virtue of radioactivity.

The intention of Part IIA is to deal with contaminated land issues that are considered to cause significant harm on land that is not undergoing development (see Environmental Protection Act 1990: Part 2A Contaminated Land Statutory Guidance, April 2012). This document replaces Annex III of Defra Circular 01/2006, published in September 2006 (the remainder of this document is now obsolete).

Planning Policy

Land contamination is often addressed via the planning process during redevelopment of sites. This approach was documented in Planning Policy Statement: Planning and Pollution Control PPS23, which states that it remains the responsibility of the landowner and developer to identify land affected by contamination and carry out sufficient remediation to render the land suitable for use. PPS23 was withdrawn early in 2012 and has been replaced by much reduced guidance within the National Planning Policy Framework (NPPF), reference ISBN: 978-1-5286-1033-9, July 2021. For sites in Wales, reference should be made to Planning Policy Wales (Welsh Government. Edition 11, February 2021).

The new framework has limited guidance on contaminated land, as follows:

Chapter 11. Making effective use of land

117 Planning policies and decisions should promote an effective use of land in meeting the need for homes and other uses, while safeguarding and improving the environment and ensuring safe and healthy living conditions. Strategic policies should set out a clear strategy for accommodating objectively assessed needs, in a way that makes as much use as possible of previously-developed or 'brownfield' land.

118. Planning policies and decisions should:

c) give substantial weight to the value of using suitable brownfield land within settlements for homes and other identified needs, and support appropriate opportunities to remediate despoiled, degraded, derelict, contaminated or unstable land.

Chapter 15. Conserving and enhancing the natural environment

170. Planning policies and decisions should contribute to and enhance the natural and local environment by:

e) preventing new and existing development from contributing to, being put at unacceptable risk from, or being adversely affected by, unacceptable levels of soil, air, water or noise pollution or land instability. Development should, wherever possible, help to improve local environmental conditions such as air and water quality, taking into account relevant information such as river basin management plans; and

f) remediating and mitigating despoiled, degraded, derelict, contaminated and unstable land, where appropriate.

Ground conditions and pollution

178. Planning policies and decisions should ensure that:

a) a site is suitable for its proposed use taking account of ground conditions and any risks arising from land instability and contamination. This includes risks arising from natural hazards or former activities such as mining, and any proposals for mitigation including land remediation (as well as potential impacts on the natural environment arising from that remediation);

b) after remediation, as a minimum, land should not be capable of being determined as contaminated land under Part 2A of the Environmental Protection Act 1990; and

c) adequate site investigation information, prepared by a competent person, is available to inform these assessments.

179. Where a site is affected by contamination or land stability issues, responsibility for securing a safe development rests with the developer and/or landowner.

Water Resources Act (WRA)

The Water Resources Act 1991 (Amendment) (England and Wales) Regulations 2009 updated the Water Resources Act 1991, which introduced the offence of causing or knowingly permitting pollution of controlled waters. The Act provides the Environment Agency with powers to implement remediation necessary to protect controlled waters and recover all reasonable costs of doing so.

Water Framework Directive (WFD)

The Water Framework Directive 2000/60/EC is designed to:

- enhance the status and prevent further deterioration of aquatic ecosystems and associated wetlands that depend on the aquatic ecosystems
- promote the sustainable use of water
- reduce pollution of water, especially by ‘priority’ and ‘priority hazardous’ substances
- ensure progressive reduction of groundwater pollution.

The WFD requires a management plan for each river basin be developed every six years.

Groundwater Directive (GWD)

The 1980 Groundwater Directive 80/68/EEC and the 2006 Groundwater Daughter Directive 2006/118/EC of the WFD are the main European legislation in place to protect groundwater. The 1980 Directive is due to be repealed in December 2013. The European legislation has been transposed into national legislation by regulations and directions to the Environment Agency.

Priority Substances Directive (PSD)

The Priority Substances Directive 2008/105/EC is a 'Daughter' Directive of the WFD, which sets out a priority list of substances posing a threat to or via the aquatic environment. The PSD establishes environmental quality standards for priority substances, which have been set at concentrations that are safe for the aquatic environment and for human health. In addition, there is a further aim of reducing (or eliminating) pollution of surface water (rivers, lakes, estuaries and coastal waters) by pollutants on the list. The WFD requires that countries establish a list of dangerous substances that are being discharged and EQS for them. In England and Wales, this list is provided in the River Basin Districts Typology, Standards and Groundwater threshold values (Water Framework Directive) (England and Wales) Directions 2010. In order to achieve the objectives of the WFD, classification schemes are used to describe where the water environment is of good quality and where it may require improvement.

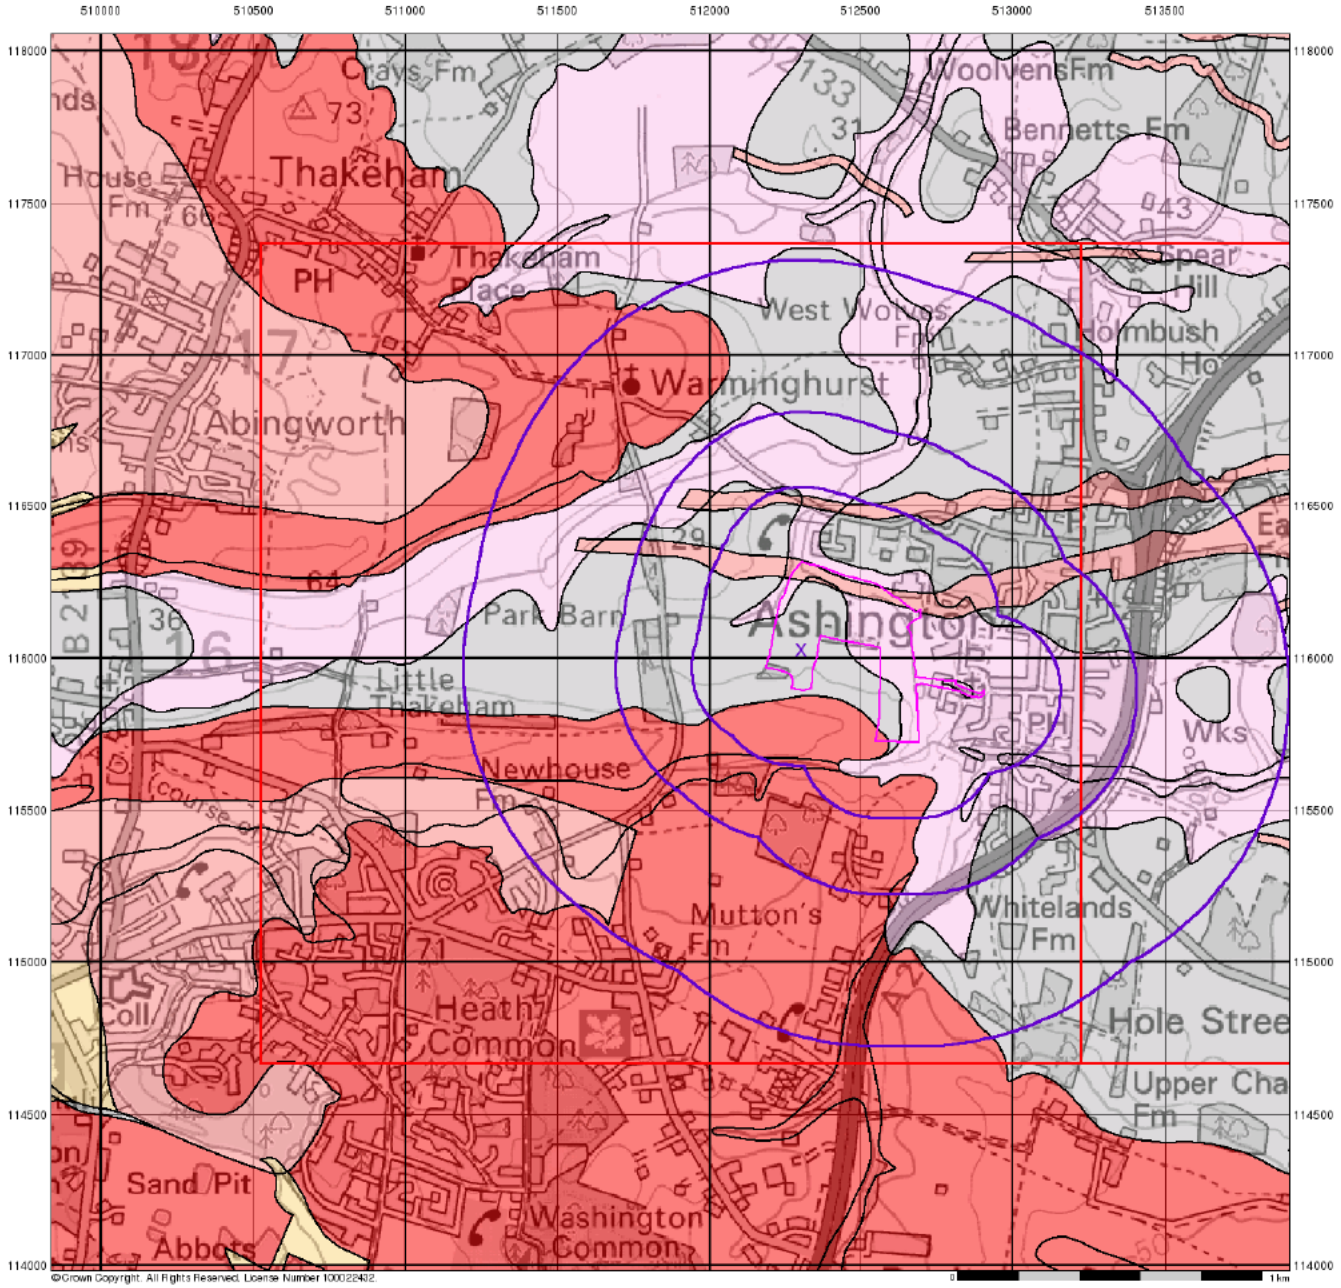

Environmental Permitting Regulations (EPR)

The Environmental Permitting (England and Wales) Regulations 2016 (as amended) provide a single regulatory framework that streamlines and integrates waste management licensing, pollution prevention and control, water discharge consenting, groundwater authorisations, and radioactive substances regulation. Schedule 22, paragraph 6 of EPR 2016 states: 'the regulator must, in exercising its relevant functions, take all necessary measures - (a) to prevent the input of any hazardous substance to groundwater; and (b) to limit the input of non-hazardous pollutants to groundwater so as to ensure that such inputs do not cause pollution of groundwater.'

Notes:

1. *The above information is provided for background but does not constitute site-specific advice*
2. *The above summary applies to England only. Variations exist within other countries of the United Kingdom*

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Summary

Data Type	Page Number	On Site	0 to 250m	251 to 500m	501 to 1000m (*up to 2000m)
Agency & Hydrological					
BGS Groundwater Flooding Susceptibility	pg 1	Yes	Yes	Yes	n/a
Contaminated Land Register Entries and Notices					
Discharge Consents	pg 2		3	4	13
Prosecutions Relating to Controlled Waters			n/a	n/a	n/a
Enforcement and Prohibition Notices					
Integrated Pollution Controls					
Integrated Pollution Prevention And Control					
Local Authority Integrated Pollution Prevention And Control					
Local Authority Pollution Prevention and Controls					
Local Authority Pollution Prevention and Control Enforcements					
Nearest Surface Water Feature	pg 6	Yes			
Pollution Incidents to Controlled Waters	pg 7		6	1	1
Prosecutions Relating to Authorised Processes					
Registered Radioactive Substances					
River Quality					
River Quality Biology Sampling Points					
River Quality Chemistry Sampling Points					
Substantiated Pollution Incident Register	pg 8			1	1
Water Abstractions	pg 8				3 (*6)
Water Industry Act Referrals					
Groundwater Vulnerability Map	pg 10	Yes	n/a	n/a	n/a
Groundwater Vulnerability - Soluble Rock Risk			n/a	n/a	n/a
Groundwater Vulnerability - Local Information			n/a	n/a	n/a
Bedrock Aquifer Designations	pg 13	Yes	n/a	n/a	n/a
Superficial Aquifer Designations	pg 13	Yes	n/a	n/a	n/a
Source Protection Zones	pg 13				1
Extreme Flooding from Rivers or Sea without Defences	pg 13		Yes	n/a	n/a
Flooding from Rivers or Sea without Defences	pg 13		Yes	n/a	n/a
Areas Benefiting from Flood Defences				n/a	n/a
Flood Water Storage Areas				n/a	n/a
Flood Defences				n/a	n/a
OS Water Network Lines	pg 13	7	48	24	63

Summary

Data Type	Page Number	On Site	0 to 250m	251 to 500m	501 to 1000m (*up to 2000m)
Waste					
BGS Recorded Landfill Sites					
Historical Landfill Sites					
Integrated Pollution Control Registered Waste Sites					
Licensed Waste Management Facilities (Landfill Boundaries)					
Licensed Waste Management Facilities (Locations)					
Local Authority Landfill Coverage	pg 30	2	n/a	n/a	n/a
Local Authority Recorded Landfill Sites					
Potentially Infilled Land (Non-Water)	pg 30				1
Potentially Infilled Land (Water)	pg 30		2		5
Registered Landfill Sites					
Registered Waste Transfer Sites					
Registered Waste Treatment or Disposal Sites					
Hazardous Substances					
Control of Major Accident Hazards Sites (COMAH)					
Explosive Sites					
Notification of Installations Handling Hazardous Substances (NIHHS)					
Planning Hazardous Substance Consents					
Planning Hazardous Substance Enforcements					

Summary

Data Type	Page Number	On Site	0 to 250m	251 to 500m	501 to 1000m (*up to 2000m)
Geological					
BGS 1:625,000 Solid Geology	pg 31	Yes	n/a	n/a	n/a
BGS Estimated Soil Chemistry	pg 31	Yes	Yes	Yes	Yes
BGS Recorded Mineral Sites					
BGS Urban Soil Chemistry					
BGS Urban Soil Chemistry Averages					
CBSCB Compensation District			n/a	n/a	n/a
Coal Mining Affected Areas			n/a	n/a	n/a
Mining Instability			n/a	n/a	n/a
Man-Made Mining Cavities					
Natural Cavities					
Non Coal Mining Areas of Great Britain	pg 32	Yes	Yes	n/a	n/a
Potential for Collapsible Ground Stability Hazards	pg 32	Yes		n/a	n/a
Potential for Compressible Ground Stability Hazards	pg 33	Yes	Yes	n/a	n/a
Potential for Ground Dissolution Stability Hazards				n/a	n/a
Potential for Landslide Ground Stability Hazards	pg 33	Yes	Yes	n/a	n/a
Potential for Running Sand Ground Stability Hazards	pg 33	Yes	Yes	n/a	n/a
Potential for Shrinking or Swelling Clay Ground Stability Hazards	pg 33	Yes	Yes	n/a	n/a
Radon Potential - Radon Affected Areas			n/a	n/a	n/a
Radon Potential - Radon Protection Measures			n/a	n/a	n/a
Industrial Land Use					
Contemporary Trade Directory Entries	pg 35		1	6	8
Fuel Station Entries					
Points of Interest - Commercial Services	pg 36			1	4
Points of Interest - Education and Health					
Points of Interest - Manufacturing and Production	pg 36			1	2
Points of Interest - Public Infrastructure					
Points of Interest - Recreational and Environmental	pg 37		5		
Gas Pipelines					
Underground Electrical Cables					

Summary

Data Type	Page Number	On Site	0 to 250m	251 to 500m	501 to 1000m (*up to 2000m)
Sensitive Land Use					
Ancient Woodland	pg 38		1		4
Areas of Adopted Green Belt					
Areas of Unadopted Green Belt					
Areas of Outstanding Natural Beauty					
Environmentally Sensitive Areas					
Forest Parks					
Local Nature Reserves					
Marine Nature Reserves					
National Nature Reserves					
National Parks					
Nitrate Sensitive Areas					
Nitrate Vulnerable Zones					
Ramsar Sites					
Sites of Special Scientific Interest					
Special Areas of Conservation					
Special Protection Areas					
World Heritage Sites

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1 50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.
The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

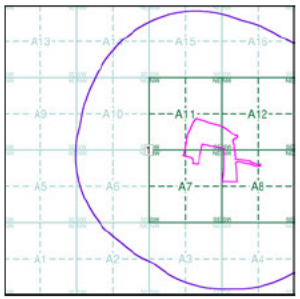

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1 8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

RSK

Bedrock and Faults

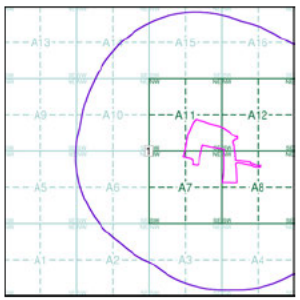

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e g. normal, thrust), and thin beds mapped as lines (e g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

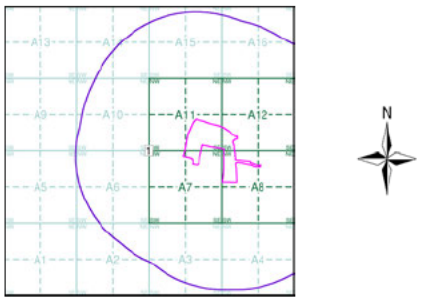

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Historical Aerial Photography

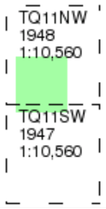

Published 1947 - 1948

Source map scale - 1:10,560

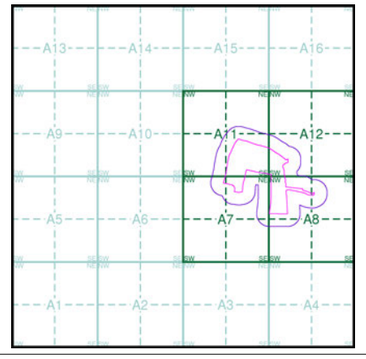

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

Sussex

Published 1952

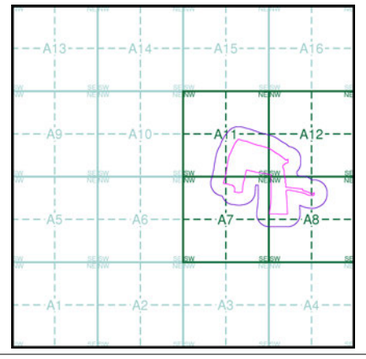

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and o her strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued un il recently, with new editions appearing every 10 years or so for urban areas.

10k Raster Mapping

Published 2000

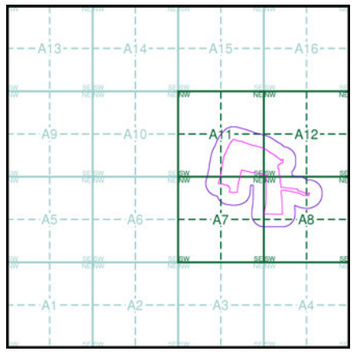

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey`s 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2021

Source map scale - 1:10,000

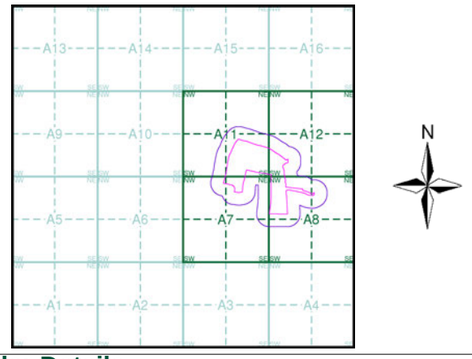

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities),1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Published 1875

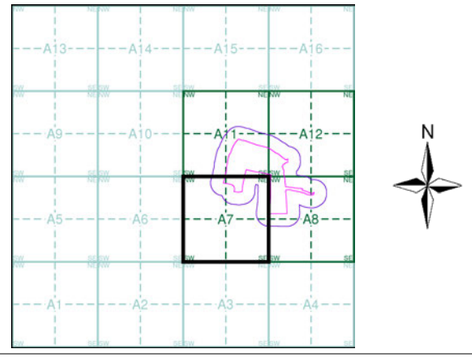

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cul ivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, wi h independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Additional SIMs

Published 1985

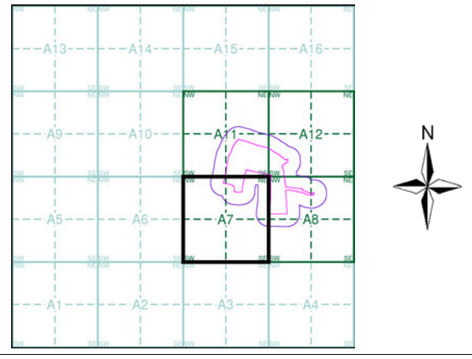

Source map scale - 1:2,500

The SIM cards (Ordnance Survey's `Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1993

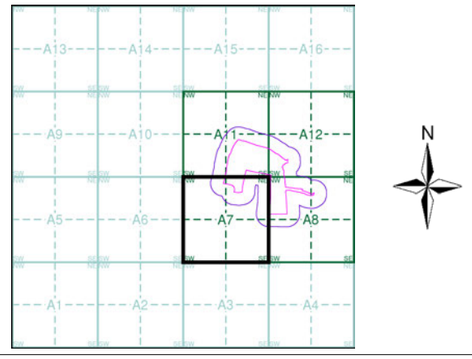

Source map scale - 1:2,500

'Large Scale Na ional Grid Data' superseded S M cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Ordnance Survey Plan

Published 1974

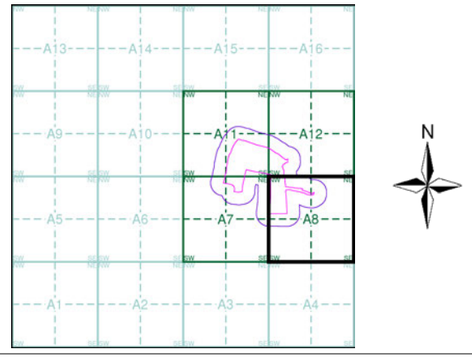

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cul ivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, wi h independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Additional SIMs

Published 1985 - 1992

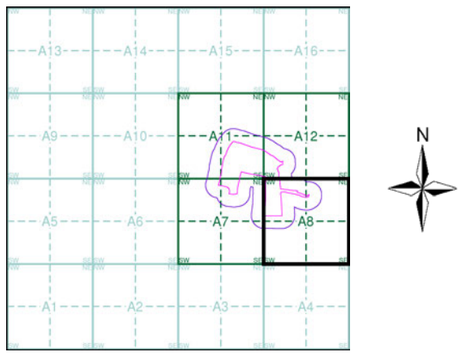

Source map scale - 1:2,500

The SIM cards (Ordnance Survey's `Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1993

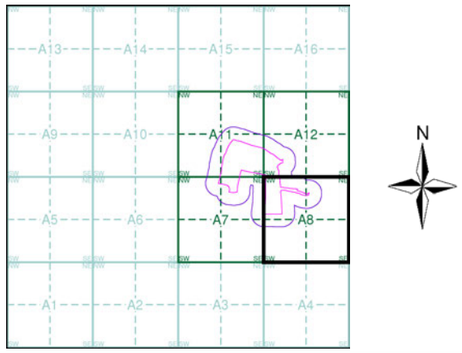

Source map scale - 1:2,500

'Large Scale Na ional Grid Data' superseded S M cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Additional SIMs

Published 1992

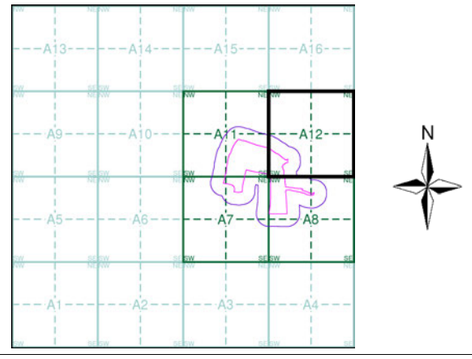

Source map scale - 1:2,500

The SIM cards (Ordnance Survey's `Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1993

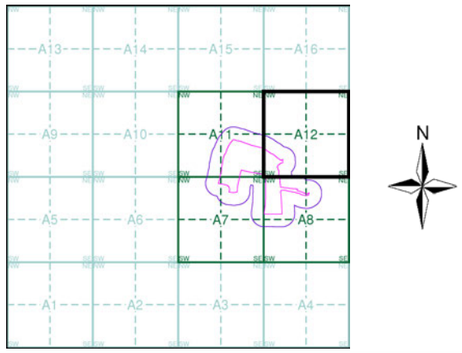

Source map scale - 1:2,500

'Large Scale Na ional Grid Data' superseded S M cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1 50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.
The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

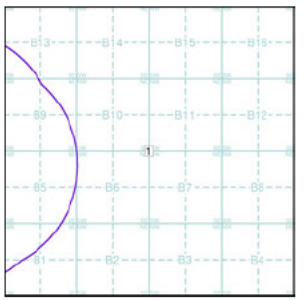

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

RSK

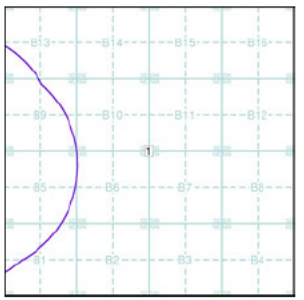

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1 8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

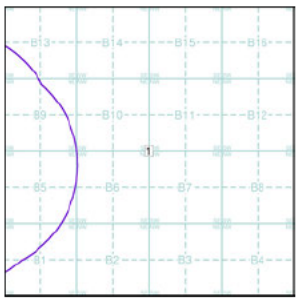

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e g. normal, thrust), and thin beds mapped as lines (e g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

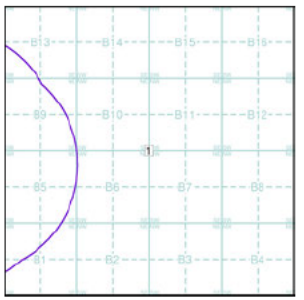

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Published 1879

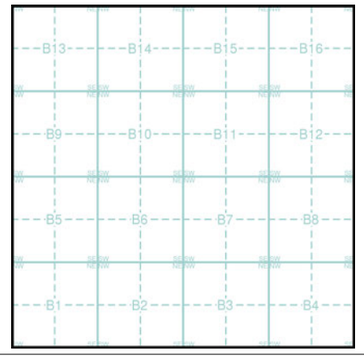

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and o her strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued un il recently, with new editions appearing every 10 years or so for urban areas.

Historical Aerial Photography

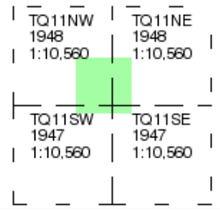

Published 1947 - 1948

Source map scale - 1:10,560

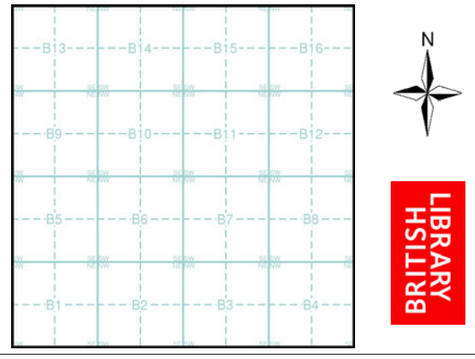

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

VectorMap Local

Published 2021

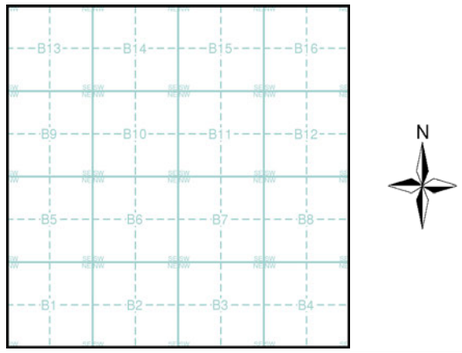

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities),1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice
Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment
A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant
A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

A selection of organisations who provide data within this report:

Envirocheck reports are compiled from 136 different sources of data.

Photo No. 16	Date:	
Description: The stream in the northern reaches of the site which is fed by the surrounding drainage ditches. This stream is a tributary of Lancing Brook.		

APPENDIX F
TECHNICAL BACKGROUND

F1 Desk Study

Aquifer designation and Source protection zones

Principal aquifer: layers of rock or drift deposit that have high intergranular and/or fracture permeability (usually providing a high level of water storage). They may support water supply and/or river base flow on a strategic scale.

Secondary A aquifer: permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers.

Secondary B aquifer: predominantly lower permeability layers that may store and yield limited amounts of groundwater due to localised features such as fissures, thin permeable horizons and weathering.

Secondary undifferentiated aquifer: it has not been possible to attribute either a category A or B to a rock type. In most cases this means that it was previously designated as both a minor and non-aquifer in different locations owing to the variable characteristics.

Unproductive' strata: low permeability with negligible significance for water supply or river base flow.

The EA generally adopts a three-fold classification of source protection zones (SPZ) surround abstractions for public water supply. The Site is situated in an area defined as follows:

- Zone 1 or the 'inner protection zone' is located immediately adjacent to the groundwater source and is based on a 50-day travel time from any point below the water table to the source. It is designed to protect against the effects of human activity and biological/chemical contaminants that may have an immediate effect on the source
- Zone 2 or the 'outer protection zone' is defined by a 400-day travel time from a point below the water table to the source. The travel time is designed to provide delay and attenuation of slowly degrading pollutants
- Zone 3 or the 'total catchment' is the area around the source within which all groundwater recharge is presumed to be discharged at the source.

Preliminary risk assessment methodology

LCRM outlines the framework to be followed for risk assessment in the UK. The framework is designed to be consistent with UK legislation and policies including planning. An outline conceptual model should be formed at the preliminary risk assessment stage that collates all the existing information pertaining to a site in text, tabular or diagrammatic form. The outline conceptual model identifies potentially complete (termed possible) contaminant linkages (contaminant–pathway–receptor) and is used as the basis for the design of the site investigation. The outline conceptual model is updated as further information becomes available, for example as a result of the site investigation.

Production of a conceptual model requires an assessment of risk to be made. Risk is a combination of the likelihood of an event occurring and the magnitude of its consequences. Therefore, both the

likelihood and the consequences of an event must be taken into account when assessing risk. RSK has adopted guidance provided in CIRIA C552 for use in the production of conceptual models.

The likelihood of an event can be classified on a four-point system using the following terms and definitions based on CIRIA C552:

- highly likely: the event appears very likely in the short term and almost inevitable over the long term or there is evidence at the receptor of harm or pollution
- likely: it is probable that an event will occur or circumstances are such that the event is not inevitable, but possible in the short term and likely over the long term
- low likelihood: circumstances are possible under which an event could occur, but it is not certain even in the long term that an event would occur and it is less likely in the short term
- unlikely: circumstances are such that it is improbable the event would occur even in the long term.

The severity can be classified using a similar system also based on CIRIA C552. The terms and definitions relating to severity are:

- severe: short term (acute) risk to human health likely to result in 'significant harm' as defined by the Environment Protection Act 1990, Part IIA. Short-term risk of pollution of sensitive water resources. Catastrophic damage to buildings or property. Short-term risk to an ecosystem or organism forming part of that ecosystem (note definition of ecosystem in 'Draft Circular on Contaminated Land', DETR 2000)
- medium: chronic damage to human health ('significant harm' as defined in 'Draft Circular on Contaminated Land', DETR 2000), pollution of sensitive water resources, significant change in an ecosystem or organism forming part of that ecosystem
- mild: pollution of non-sensitive water resources. Significant damage to crops, buildings, structures and services ('significant harm' as defined in 'Draft Circular on Contaminated Land', DETR 2000). Damage to sensitive buildings, structures or the environment
- minor: harm, not necessarily significant, but that could result in financial loss or expenditure to resolve. Non-permanent human health effects easily prevented by use of personal protective clothing. Easily repairable damage to buildings, structures and services.

Once the probability of an event occurring and its consequences have been classified, a risk category can be assigned according to the table below.

		Consequences			
		Severe	**Medium**	**Mild**	**Minor**
Probability	**Highly likely**	Very high	High	Moderate	Moderate/low
	Likely	High	Moderate	Moderate/low	Low
	Low likelihood	Moderate	Moderate/low	Low	Very low
	Unlikely	Moderate/low	Low	Very low	Very low

Definitions of these risk categories are as follows together with an assessment of the further work that may be required:

- very high: there is a high probability that severe harm could occur or there is evidence that severe harm is currently happening. This risk, if realised, could result in substantial liability; urgent investigation and remediation are likely to be required
- high: harm is likely to occur. Realisation of the risk is likely to present a substantial liability. Urgent investigation is required. Remedial works may be necessary in the short term and are likely over the long term
- moderate: it is possible that harm could arise, but it is unlikely that the harm would be severe and it is more likely that the harm would be relatively mild. Investigation is normally required to clarify the risk and determine the liability. Some remedial works may be required in the longer term
- low: it is possible that harm could occur, but it is likely that if realised this harm would at worst normally be mild
- very low: there is a low possibility that harm could occur and if realised the harm is unlikely to be severe.

F2 Site Investigation Methodology

Ground gas monitoring

An infrared gas meter was used to measure gas flow, concentrations of carbon dioxide (CO_2), methane (CH_4) and oxygen (O_2) in percentage by volume, while hydrogen sulphide (H_2S) and carbon monoxide (CO) were recorded in parts per million. Initial and steady state concentrations were recorded. In addition, during the first monitoring round, all wells were screened with a PID to establish if there are any interferences and cross-sensitivity of other hydrocarbons with the infrared gas meter.

Low flow groundwater sampling

Groundwater samples were retrieved using a United States Environment Protection Agency (USEPA) approved low-flow purging and sampling methodology.

The low-flow method relies on moving groundwater through the well screen at approximately the same rate as it flows through the geological formation. This results in a significant reduction in the volume of water extracted before sampling and significantly reduces the amount of disturbance of the water in the monitoring well during purging and sampling. Drawdown levels in the monitoring well and water quality indicator parameters (pH, temperature, electrical conductivity, redox potential and dissolved oxygen) are monitored during low-flow purging and sampling, with stabilisation indicating that purging is complete and sampling can begin. As the flow rate used for purging, in most cases, is the same or only slightly higher than the flow rate used for sampling, and because purging and sampling are conducted as one continuous operation in the field, the process is referred to as low-flow purging and sampling.

Reuse of suitable materials

The Definition of Waste: Development Industry Code of Practice (CL:AIRE, 2011) (CoP) was developed in consultation with the Environment Agency and development industry to enable the

re-use of materials under certain scenarios and subject to demonstrating that specific criteria are met. The current reuse scenarios covered by the CoP comprise

- reuse on the site of origin (with or without treatment)
- direct transfer of clean and natural soils between sites
- use in the development of land other than the site of origin following treatment at an authorised Hub site (including a fixed soil treatment facility).

The importation of made ground soils (irrespective of contamination status) or crushed demolition materials is not permitted currently under the CoP and requires either a standard rules environmental permit or a U1 waste exemption (see below).

In the context of excavated materials used on-sites undergoing development, four factors are considered to be of particular relevance in determining if the material is a waste or when it ceases to be waste:

- the aim of the Waste Framework Directive is not undermined, i.e. if the use of the material will create an unacceptable risk of pollution of the environment or harm to human health it is likely to be waste
- the material is certain to be used
- the material is suitable for use both chemically and geotechnically
- only the required quantity of material will be used.

The CoP requires the preparation of a materials management plan (MMP) that confirms the above factors will be met. This plan needs to be reviewed by a 'Qualified Person' (QP) who will then issue a declaration form to the EA. As the project progresses, data must be collated and on completion a verification report produced that shows the MMP was followed and describes any changes.

The MMP establishes whether specific materials are classified as waste and how excavated materials will be treated and/or reused in line with the CoP. The MMP is likely to form part of the site waste management plan.

Window Run	Depth	No	Type	Results					
	0.10-0.20	1	ES				Grass over soft brown silty sandy gravelly CLAY. Sand is fine to coarse. Gravel is angular fine to medium chalk and wood. Frequent rootlets. (TOPSOIL)	0.20	
	0 20		PID	0.0ppm			Soft orangish brown sandy CLAY. Sand is fine to coarse. Occasional rootlets. (WEALD CLAY FORMATION)	0.40	
	0.50-0.70	1	D				Firm orangish brown grey mottled slightly gravelly sandy CLAY. Sand is fine to coarse. Gravel is angular to subangular fine to medium flint. Frequent black organics (decayed roots). (WEALD CLAY FORMATION)	(0.80)	
	1 00-1.45	1	SPT	N=20				1.20	
							Firm orange light grey mottled very sandy CLAY. Sand is fine to coarse. Frequent black organics. (WEALD CLAY FORMATION)	1.30	
	1.50-1.70	2	D				Orange light grey mottled clayey fine to coarse SAND. (WEALD CLAY FORMATION)	1.50	
	1.80		V	c_u=76/73/72			Stiff medium strength light grey orange mottled sandy CLAY. Sand is fine to coarse. Frequent black organics. (WEALD CLAY FORMATION)	(0.40)	
	2 00-2.45	2	SPT	N=34				1.90	
							Stiff light grey orange mottled very sandy CLAY. Sand is fine to coarse. (WEALD CLAY FORMATION)	2.00	
							Orangish brown clayey fine to coarse SAND. (WEALD CLAY FORMATION)	(0.30)	
	2.50-2.70	3	D				Very stiff high strength dark grey orange mottled sandy CLAY. Sand is fine to coarse. (WEALD CLAY FORMATION)	2.30	
	2.50		V	c_u=87/85/84				(0.85)	
	2.70-3.15	3	SPT	N=35				3.15	
							Window sample hole terminated at 3.15m depth due to refusal.		

Drilling Progress and Water Observations					
Date	Time	Borehole Depth (m)	Casing Depth (m)	Borehole Diameter (mm)	Water Depth (m)

General Remarks

1. Inspection pit hand dug to 1.00m depth.
2. No groundwater encountered.
3. Installed to 2.70m - 1.00m plain pipe, 2.00m slotted (0.30m plain pipe above ground level).

APPENDIX I
LABORATORY CERTIFICATES FOR SOIL ANALYSIS

APPENDIX J
LABORATORY CERTIFICATES FOR GEOTECHNICAL ANALYSIS

APPENDIX K
GENERIC ASSESSMENT CRITERIA FOR HUMAN HEALTH

APPENDIX L
GENERIC ASSESSMENT CRITERIA FOR PHYTOTOXIC EFFECTS

APPENDIX M
GENERIC ASSESSMENT CRITERIA POTABLE WATER SUPPLY PIPES

A range of pipe materials is available and careful selection, design and installation is required to ensure that water supply pipes are satisfactorily installed and meet the requirements of the Water Supply (Water Fittings) Regulations 1999 in England and Wales, the Byelaws 2000 in Scotland and the Northern Ireland Water Regulations. The regulations include a requirement to use only suitable materials when laying water pipes and laying water pipes without protection is not permitted at contaminated sites. The water supply company has a statutory duty to enforce the regulations.

Contaminants in the ground can pose a risk to human health by permeating potable water supply pipes. To fulfil their statutory obligation, UK water supply companies require robust evidence from developers to demonstrate either that the ground in which new plastic supply pipes will be laid is free from specific contaminants, or that the proposed remedial strategy will mitigate any existing risk. If these requirements cannot be demonstrated to the satisfaction of the relevant water company, it becomes necessary to specify an alternative pipe material on the whole development or in specific zones.

In 2010, UK Water Industry Research (UKWIR) published *Guidance for the Selection of Water Supply Pipes to be used in Brownfield Sites* (Report Ref. No. 10/WM/03/21). This report reviewed previously published industry guidelines and threshold concentrations adopted by individual water supply companies.

The focus of the UKWIR research project was to develop clear and concise procedures, which provide consistency in the pipe selection decision process. It was intended to provide guidance that can be used to ensure compliance with current regulations and to prevent water supply pipe failing prematurely due to the presence of contamination.

The report concluded that in most circumstances only organic contaminants pose a potential risk to plastic pipe materials and Table 3.1 of the report provides threshold concentrations for polyethylene (PE) and polyvinyl chloride (PVC) pipes for the organic contaminants of concern. The report also makes recommendations for the procedures to be adopted in the design of site investigations and sampling strategies, and the assessment of data, to ensure that the ground through which water supply pipes will be laid is adequately characterised.

Risks to water supply pipes have therefore been assessed against the threshold concentrations for PE and PVC pipe specified in Table 3.1 of Report 10/WM/03/21, which have been adopted as the GAC for this linkage and are reproduced in Table A3 below.

Since water supply pipes are typically laid at a minimum depth of 0.75 m below finished ground levels, sample results from depths between 0.5 m and 1.5 m below finished level are generally considered suitable for assessing risks to water supply. Samples outside these depths can be used, providing the stratum is the same as that in which water supply pipes are likely to be located. The report specifies that sampling should characterise the ground conditions to a minimum of 0.5 m below the proposed depth of the pipe.

It should be noted that the assessment provided in this report is a guide and the method of assessment and recommendations should be checked with the relevant water supply company.

Table Q1: Generic assessment criteria for water supply pipes

		Pipe material	
		GAC (mg/kg)	
	Parameter group	PE	PVC
1	Extended VOC suite by purge and trap or head space and GC-MS with TIC (Not including compounds within group 1a)	0.5	0.125
1a	• BTEX + MTBE	0.1	0.03
2	SVOCs TIC by purge and trap or head space and GC-MS with TIC (aliphatic and aromatic C_5–C_{10}) (Not including compounds within group 2e and 2f)	2	1.4
2e	• Phenols	2	0.4
2f	• Cresols and chlorinated phenols	2	0.04
3	Mineral oil C_{11}–C_{20}	10	Suitable
4	Mineral oil C_{21}–C_{40}	500	Suitable
5	Corrosive (conductivity, redox and pH)	Suitable	Suitable
Specific suite identified as relevant following site investigation			
2a	Ethers	0.5	1
2b	Nitrobenzene	0.5	0.4
2c	Ketones	0.5	0.02
2d	Aldehydes	0.5	0.02
6	Amines	Not suitable	Suitable
Notes: where indicated as 'suitable', the material is considered resistant to permeation or degradation and no threshold concentration has been specified by UKWIR.

Appendix G

SuDS Treatment

Surface Water Strategy Parameters:

Total Site Area (redline) = 14.95ha

Total Development Area (exc. woodland and open space) = 6.61 ha. This is the area estimated to be contributing to greenfield runoff into the watercourses connected to the outfall, within the developable area.

Greenfield Runoff Rates (calculated from Microdrainage):

1 year = 12.9l/s
Qbar = 15.2l/s
30 year = 34.4l/s
100 year = 48.4l/s

Measured impermeable area for drainage calculations = 3.46 ha

Storage Requirements (calculated from Microdrainage)

Approximately 2774m3 is required for 100yr + 45% Climate Change based on the QBar greenfield rates. The exact volume will be verified during detailed design of the drainage network but there is adequate provision in the masterplan to attenuate the runoff from site.

Storage Provided:

A 2m deep (plus 300mm freeboard) SuDS detention basin has been provided in the western open space near the outfall watercourse. This basin is sized to provide the required storage.

An additional swale has been provided downstream to improve water quality but has not been included in the storage calculations.

NOTES:

1. THIS DRAWING IS TO BE READ IN CONJUNCTION WITH THE RELEVANT SPECIFICATION AND ALL OTHER RELATED DRAWINGS ISSUED BY THE ENGINEER.
2. DO NOT SCALE FROM THIS DRAWING. WORK FROM FIGURED DIMENSIONS ONLY.
3. ALL DIMENSIONS SHOWN ON THIS DRAWING ARE IN MILLIMETRES UNLESS OTHERWISE STATED.
4. ALL DIMENSIONS, LEVELS AND SURVEY GRID CO-ORDINATES ARE TO BE CHECKED ON SITE AND THE ENGINEER NOTIFIED IMMEDIATELY OF ANY DISCREPANCIES PRIOR TO THE COMMENCEMENT OF THE WORKS.
5. NO DEVIATION FROM THE DETAILS SHOWN ON THIS DRAWING IS PERMITTED WITHOUT PRIOR PERMISSION FROM THE ENGINEER.
6. THE AVOIDANCE AND PROTECTION OF SERVICES DURING THE WORKS IS THE RESPONSIBILITY OF THE CONTRACTOR.
7. THE CONTRACTOR IS REMINDED OF HIS OBLIGATION TO VERIFY THE ROUTE OF ALL SERVICES ON SITE PRIOR TO THE COMMENCEMENT OF THE WORKS.
8. THE CONTRACTOR SHOULD ALLOW FOR ANY NECESSARY LIAISON WITH THE STATUTORY UTILITIES DURING THE COURSE OF THE WORKS TO AVOID ANY DISRUPTION TO RETAINED SERVICES.
9. THE CONTRACTOR SHOULD NOTE THAT THE SERVICES SHOWN ARE NOT TO BE CONSIDERED EXHAUSTIVE. PRIVATE SERVICES MAY BE PRESENT WITHIN THE LIMIT OF WORKS AND CARE SHOULD BE TAKEN TO LOCATE AND AVOID THESE DURING CONSTRUCTION.
10. ALL INFORMATION IS INDICATIVE AND IS FOR INFORMATION ONLY.

Appendix G

SuDS Treatment

Pollution hazard indices for different land use classifications (land use shaded grey applicable for the development)

Land use	Pollution hazard level	Total suspended solids (TSS)	Metals	Hydrocarbons
Residential roofs	Very low	0.2	0.2	0.05
Other roofs (typically commercial/industrial roofs)	Low	0.3	0.2 (up to 0.8 where there is potential for metals to leach from the roof)	0.05
Individual property driveways, residential car parks, low traffic roads (eg cul de sacs, home zones and general access roads) and non-residential car parking with infrequent change (eg schools, offices) ie < 300 traffic movements/day	Low	0.5	0.4	0.4
Commercial yard and delivery areas, non-residential car parking with frequent change (e.g. hospitals, retail), all roads except low traffic roads and trunk roads/motorways	Medium	0.7	0.6	0.7
Sites with heavy pollution (e.g. haulage yards, lorry parks, highly frequented lorry approaches to industrial estates, waste sites), sites where chemicals and fuels (other than domestic fuel oil) are to be delivered, handled, stored, used or manufactured; industrial sites; trunk roads and motorways	High	0.8	0.8	0.9

Indicative SuDS mitigation indices for discharges to surface waters (SuDS components shaded grey applicable to this development)

	Mitigation indices		
Type of SuDS component	**TSS**	**Metals**	**Hydrocarbons**
Filter strip	0.4	0.4	0.5
Filter drain	0.4	0.4	0.4
Swale	0.5	0.6	0.6
Bio retention system	0.8	0.8	0.8
Permeable pavement	0.7	0.6	0.7
Detention basin	0.5	0.5	0.6
Pond	0.7	0.7	0.5
Wetland	0.8	0.8	0.8
Proprietary treatment systems	These must demonstrate that they can address each of the contaminant types to acceptable levels for frequent events up to approximately the 1 in 1 year return period event, for inflow concentrations relevant to the contributing drainage area.		

Indicative SuDS mitigation indices for discharges to groundwater – N/A

(SuDS components shaded grey applicable to this development)

	Mitigation indices		
Characteristic of the material overlying the proposed infiltration surface, through which the runoff percolates	**TSS**	**Metals**	**Hydro-carbons**
A layer of dense vegetation underlain by a soil with good contaminant attenuation potential of at least 300mm in depth	0.6	0.5	0.6
A soil with good contaminant attenuation potential of at least 300mm in depth	0.4	0.3	0.3
Infiltration trench underlain by a soil with good contaminant attenuation potential of at least 300mm in depth	0.4	0.4	0.4
Constructed permeable paving underlain by a soil with a good contaminant attenuation potential of at least 300mm in depth	0.7	0.6	0.7
Bio retention underlain by a soil with good contaminant attenuation potential of at least 300mm in depth	0.8	0.8	0.8
Proprietary treatment systems	These must demonstrate that they can address each of the contaminant types to acceptable levels for inflow concentrations relevant to the contributing drainage area.		

Indicative SuDS mitigation indices for discharges to surface waters

For surface water discharge from Residential Parking Areas and Low Traffic Roads <300 traffic movements/day			
	Required mitigation indices		
Source	**TSS**	**Metals**	**Hydrocarbons**
Medium	0.7	0.6	0.7
Private Drainage Network			
N/A – see below	-	-	-
Check	+0	+0	+0
Highway Drainage Network			
Basin (mitigation index$_1$)	0.5	0.5	0.6
Swale (mitigation index$_2$)	0.5	0.6	0.6
Total	0.75	0.8	0.9
Check	+0.05	+0.2	+0.2

Total SuDS mitigation index = mitigation index$_1$ + (0.5 x mitigation index$_2$)

Appendix H

Maintenance Plan

Maintenance and Management

The highway network including the pumping station will be offered for adoption and maintained by the local highway authority (or equivalent) under a section 104. The swales, basin and shared private pipework would be maintained by a management company set up by the developer. As construction has not yet commenced, the process of finalising the management company contract has not yet commenced. The developer will ensure that the measures as outlined below form part of the management company contract details, for the ongoing maintenance of all SuDS features on site.

The indicative maintenance requirements for each proposed SuDS component is given below. Taken from CIRIA report C753 "The SuDS Manual".

Drainage Pipes

Maintenance schedule	Required action	Typical frequency
Regular Maintenance	Remove sediment and debris from inspection chambers and hydrobrake chambers	Annually
	Cleaning of gutters and any filters on downpipes	Annually
	Remove any root ingress	As required
Occasional Maintenance	CCTV survey of drains to check alignment, cracking and joint displacement	10 year intervals

Swales/Basins

Maintenance Period	Maintenance Task	Frequency
Regular Maintenance	Remove litter and debris	Monthly, or as required
	Cut the grass – to retain grass height within specified design range	Monthly (during growing season) or as required
	Manage other vegetation and remove nuisance plants	Monthly at start, then as required

	Inspect inlets, outlets and overflows for blockages, and clear if required	Monthly
	Inspect infiltration surfaces for ponding, compaction, silt accumulation, record areas where water is ponding for > 48 hours	Monthly, or when required
	Inspect vegetation coverage	Monthly for 6 months, quarterly for 2 years, then half yearly
	Inspect inlets and facility surface for silt accumulation, establish appropriate silt removal frequencies	Half yearly
Occasional Maintenance	Reseed areas of poor vegetation growth; alter plant types to better suit conditions, if required	As required or if bare soil is exposed over > 10% of the filter strip area
Remedial Actions	Repair erosion or other damage by re-turfing or reseeding	As required
	Relevel uneven surfaces and reinstate design levels	As required
	Scarify and spike topsoil layer to improve infiltration performance, break up silt deposits and prevent compaction of the soil surface	As required
	Remove build-up of sediment on upstream gravel trench, flow spreader or at top of filter strip	As required
	Remove and dispose of oils or petrol residues using safe standard practices	As required
