

Horsham District Council
Habitats Regulations Assessment Appropriate Assessment Record

Plan/project: DC/26/1138| Erection of a chalet style self-build dwelling with associated access from New Road and driveway/car parking. | Land Adjacent To 1 Woodcot New Road Billingshurst West Sussex RH14 9DS

The purpose of this HRA record is to assess the need for appropriate assessment in relation to the plan/project detailed above.

The Conservation of Habitats and Species Regulations 2017 (as amended) requires that a Habitats Regulations Assessment screening is carried out in relation to any plan or project which is likely to have a significant effect on Habitats (European) sites, either alone or in combination with other plans or projects. European sites are Special Protection Areas and Special Areas of Conservation. Ramsar sites should also be given the same level of protection, as stated within the National Planning Policy Framework.

In line with the Court judgement (CJEU *People Over Wind v Coillte Teoranta* C-323/17), mitigation measures cannot be taken into account when carrying out a screening assessment to decide whether a development is likely to result in significant effects on a Habitats site. **This report is therefore an Appropriate Assessment under the Conservation of Habitats and Species Regulations 2017 (as amended).**

Where an Appropriate Assessment is carried out a project may only be authorised after having ascertained that it will not adversely affect the integrity of the site(s) concerned.

Table 1: Screening matrix

Stage 1 HRA screening	
Brief description of the Plan/Project	Application: DC/26/1138 Planning Application: Erection of a chalet style self-build dwelling with associated access from New Road and driveway/car parking. Location: Land Adjacent To 1 Woodcot New Road Billingshurst West Sussex RH14 9DS
Brief description of the Habitats sites within scope of this assessment	The Mens SAC (Sussex bat SAC), The Ebernoe Common SAC lie within West Sussex and the Impact Risk Zones identified by Natural England includes Horsham District. The Mens Special Area of Conservation (SAC) is located approximately 6.8km southwest of the site and lists Barbastelle bats as a qualifying feature. A long and varied history of management has seen The Mens move from an open, wood pasture system with huge, spreading parkland trees and pollards to a high forest with closely spaced trees with narrow crowns. A lack of management in recent years has added to this silvicultural diversity. Ebernoe Common SAC is located approximately 12.0km to the west of the site and lists Barbastelle and Bechstein's bats as qualifying features. Ebernoe Common is dominated by old wood pasture where Commoners would have turned out their cattle or pigs to graze and browse on young trees and scrub, beech mast and acorns, or on the grassy meadows in glades and clearings. Grazing stopped by the middle of the 20th century and the wood pasture became more and more overgrown. Great effort has been put into opening up glades and rides and restoring grazing to this SAC. Arun Valley SAC, SPA and Ramsar is approximately 10.1km to the southwest and lists rare and diverse plant, invertebrate and bird assemblages as qualifying features. It consists of low-lying grazing marsh, largely on alluvial soils, but with an area of peat derived from a relict raised bog. Variation in soils and water supply lead to a wide range of ecological conditions and hence a rich flora and fauna.

The Mens SAC

Annex I habitats that are a primary reason for selection of the site:

9120 Atlantic acidophilous beech forests with *Ilex* and sometimes also *Taxus* in the shrub layer (*Quercion robori-petraeae* or *Ilici-Fagenion*)

The Mens is an extensive area of mature Beech *Fagus sylvatica* woodland rich in lichens, bryophytes, fungi and saproxylic invertebrates, and is one of the largest tracts of Atlantic acidophilous beech forests in the south-eastern part of the habitat's UK range. It is developing a near-natural high forest structure, in response to only limited silvicultural intervention over the 20th century, combined with the effects of natural events such as the 1987 great storm.

Annex II species present as a qualifying feature, but not a primary reason for site selection:

1308 Barbastelle *Barbastella barbastellus*

Ebernoe Common SAC

Annex I habitats that are a primary reason for selection of this site

9120 Atlantic acidophilous Beech forests with *Ilex* and sometimes also *Taxus* in the shrub layer (*Quercion robori-petraeae* or *Ilici-Fagenion*).

Ebernoe Common has an extensive block of Beech high forest and former wood-pasture over dense Holly *Ilex aquifolium*, and has a very rich epiphytic lichen flora, including *Agonimia octospora* and *Catillaria atropurpurea*. It represents Atlantic acidophilous Beech forests in the south-eastern part of the habitat's UK range. The Beech woodland is associated with other woodland types, open glades and pools, which contribute to a high overall diversity. The woods are important for a number of bat species, in particular 1323 Bechstein's bat *Myotis bechsteinii* and 1308 Barbastelle.

Annex II species that are a primary reason for selection of this site:

1308 Barbastelle *Barbastella barbastellus*

A maternity colony of Barbastelles utilises a range of tree roosts in this area of 91A0 old sessile Oak woods with *Ilex* and *Blechnum* in the British Isles, which has a dense understorey of holly as well as open glades and open water. Maternity roost sites are usually in dead tree stumps, but the species appears to be present throughout the year, with individuals utilising a range of roost sites in tree holes and under bark.

1323 Bechstein's bat *Myotis bechsteinii*

A maternity colony of Bechstein's bat is associated with this area of 91A0 Old sessile Oak woods with *Ilex* and *Blechnum* in the British Isles. Roosts are mainly in old woodpecker holes in the stems of live mature oak *Quercus petraea* trees.

Arun Valley SPA

A037 Bewick's swan, *Cygnus columbianus bewickii* (non-breeding).

During the time of site notification, the SPA supported 115 individuals representing at least 1.6% of the wintering population in Great Britain (5 year peak mean 1992/93 - 1996/97).

During the non-breeding season, the SPA regularly supports an assemblage of waterfowl with the area regularly supporting 27,241 individual waterfowl (5 year peak mean for 1992/93 to 1996/97) including: Shoveler *Anas clypeata*, Teal

	<i>Anas crecca</i>, Wigeon <i>Anas penelope</i>, Bewick's Swan <i>Cygnus columbianus bewickii</i>. Arun Valley SAC 4056 Little Whirlpool Ramshorn snail <i>Anisus vorticulus</i> <i>Anisus vorticulus</i> occurs across a range of sites in southern and eastern England. The Arun valley is one of the three main population centres for this species in the UK. This proposed site includes two of its core sites in the wash lands of the Arun floodplain (Pulborough Brooks and Amberley Wild Brooks SSSIs.
Qualifying Features for Ramsar	Arun Valley Ramsar Ramsar criterion 2 The site holds seven wetland invertebrate species listed in the British Red Data Book as threatened. One of these, <i>Pseudamnicola confusa</i>, is considered to be endangered. The site also supports four nationally rare and four nationally scarce plant species Ramsar criterion 3 In addition to the Red Data Book invertebrate and plant species, the ditches intersecting the site have a particularly diverse and rich flora. All five British duckweed (<i>Lemna</i> species), all five water-cress (<i>Rorippa</i> species), and all three British water milfoils (<i>Myriophyllum</i> species), all but one of the seven British water dropworts (<i>Oenanthe</i> species), and two-thirds of the British pondweeds (<i>Potamogeton</i> species) can be found on site. Ramsar criterion 5 Assemblages of international importance: Species with peak counts in winter: 13774 waterfowl (5 year peak mean 1998/99-2002/2003).
Conservation Status of the relevant Qualifying Features	The Mens SAC The Barbastelle is one of the UK's rarest mammals. Few maternity roost sites are known in the UK. While the SAC series makes a contribution to securing favourable conservation status for this Annex II species, wider measures are also necessary to support its conservation in the UK These are outlined in the Species Biodiversity Action Plan (DEFRA website). <i>It is likely that its low population density and slow population growth make it particularly vulnerable to:</i> • further loss and fragmentation of ancient deciduous woodland habitat; • loss, destruction and disturbance of roosts in buildings, trees and underground sites; • a reduction in numbers of insect prey due to habitat simplification acting through factors such as fertiliser use and intensive grazing. Ebernoe Common SAC Barbastelle as outlined for The Mens SAC. Bechstein's Bat Species Biodiversity Action Plan (DEFRA website): <i>The rarity of this species means that it is poorly understood, but according to the national species action plan, its low population density, exacting habitat requirements and low rates of reproduction make it particularly vulnerable to factors such as:</i> • Further loss and fragmentation of open ancient deciduous woodland habitat. • Loss, destruction and disturbance of roosts or potential roosts (particularly in old trees). Arun Valley SAC, SPA and Ramsar In line with the national trend, the number of Bewick's swans wintering in the Arun Valley has declined since the time of designation and is now typically

	fewer than 50 birds. This may reflect an overall decline in the population of the species and/or be due to the effects of a milder climate in which more are able to winter in continental Europe (The Birds of Sussex, 2014). The waterfowl assemblage numbers fluctuate depending upon conditions in the valley but over the past five years have averaged 40,311, an increase from the five year mean of 27,241 at the time of designation. The Arun Valley is one of the remaining strongholds for the Little Whirlpool Ramshorn Snail.
Conservation Objectives (Only Relevant for SPA/SAC)	The Mens SAC Ensure that the integrity of the site is maintained or restored as appropriate, and ensure that the site contributes to achieving the Favourable Conservation Status of its Qualifying Features, by maintaining or restoring; • The extent and distribution of qualifying natural habitats and habitats of qualifying species • The structure and function (including typical species) of qualifying natural habitats • The structure and function of the habitats of qualifying species • The supporting processes on which qualifying natural habitats and the habitats of qualifying species rely • The populations of qualifying species, and, • The distribution of qualifying species within the site. Ebernoe Common SAC Ensure that the integrity of the site is maintained or restored as appropriate, and ensure that the site contributes to achieving the Favourable Conservation Status of its Qualifying Features, by maintaining or restoring; • The extent and distribution of qualifying natural habitats and habitats of qualifying species • The structure and function (including typical species) of qualifying natural habitats • The structure and function of the habitats of qualifying species • The supporting processes on which qualifying natural habitats and the habitats of qualifying species rely • The populations of qualifying species, and, • The distribution of qualifying species within the site. Arun Valley SAC & SPA Ensure that the integrity of the site is maintained or restored as appropriate, and ensure that the site contributes to achieving the aims of the Wild Birds Directive, by maintaining or restoring; • The extent and distribution of the habitats of the qualifying features • The structure and function of the habitats of the qualifying features • The supporting processes on which the habitats of the qualifying features rely • The population of each of the qualifying features, and, • The distribution of the qualifying features within the site.
Key vulnerabilities / factors affecting site integrity	Issues listed in the relevant Site Improvement Plan (SIP) are: The Mens SAC • Forestry and woodland management; • Habitat connectivity for barbastelle bats; • Invasive species; • Changes in land management, with reference to foraging and commuting routes; • Air pollution, risk of atmospheric nitrogen deposition; • Public access / disturbance, with regards to light levels. The mechanism for addressing these issues within the SIP is investigation,

	research and monitoring; with the exception of appropriate management, and removal of, rhododendron, within The Mens SAC. Ebernoe Common SAC • Forestry and woodland management; • Off-site habitat availability / management; • Habitat fragmentation; • Change in land management, with reference to foraging and commuting routes for Barbastelles; • Hydrological changes; • Air pollution, risk of atmospheric nitrogen deposition; • Public access / disturbance, with regards to light levels. Again, the mechanism for addressing all of these issues within the SIP is investigation, research, monitoring at this stage. Arun Valley SAC and SPA • Inappropriate water levels • Water pollution • Inappropriate ditch management • Disturbance Again, the mechanism for addressing all of these issues within the SIP is investigation, research, monitoring at this stage. However, for applications where increased demand for water resources is the only pathway for impacts, Natural England's substantive advice (Position Statement Interim Approach, September 2021) is that such applications - without mitigation - will result in a likely significant effect on the Arun Valley SAC/SPA/Ramsar site in combination with other developments in the Sussex North WSZ. As it cannot be concluded that the existing abstraction within Sussex North Water Supply Zone is not having an impact on the Arun Valley sites, developments within this zone must not add to this impact. Therefore, such applications, even where mitigation is proposed, must progress to Appropriate Assessment (AA). Natural England's substantive advice (September 2021) is that the Sussex North Water Supply Zone includes supplies from a groundwater abstraction which cannot, with certainty, conclude no adverse effect on the integrity of; • Arun Valley Special Area Conservation (SAC) • Arun Valley Special Protection Area (SPA) • Arun Valley Ramsar Site
Assessment Criteria	
The individual elements of the project (either alone or in combination with other plans or projects) likely to give rise to impacts on the Habitats site	There are no records for Barbastelle bat within 2km of the site, and no European Protected Species Mitigation Licences have been granted for this species within 2km of the site (Sussex Biodiversity Record Centre – accessed under licence) and MAGIC maps https://magic.defra.gov.uk/MagicMap.aspx). The Sussex Bat Special Area of Conservation Planning and Landscape Scale Enhancement Protocol provides advice for developers and local Councils when assessing applications which fall within an identified 12 km Impact Zone for The Men's SAC, Ebernoe Common SAC. In line with this Protocol, this application is located within the wider Conservation Area of both The Mens and Ebernoe Common SACs, and significant impacts or severance to flightlines need to be considered. This development does not occur along one of the identified flightlines.

From the submitted documents, it appears that the site comprises lowland mixed deciduous woodland, modified grassland, sparsely vegetated urban land and developed land, sealed surface. The site connects to ancient and deciduous woodland in the wider landscape. There is a 10m long native hedgerow comprising Ash, Hazel, Bramble and Ivy on the southwestern boundary. Four trees were removed prior to the ecological survey and the documents indicate that one Ash tree, and Groups G2 (Ash), G3 (Ash) and G5 (Ash and Field Maple) will be removed.

Based on the threats listed in the SIPs, the following potential impact pathways are considered with reference to the development proposals regarding the need for further assessment:

Direct land take - The proposed development will not result in any direct land take from any designated sites. Direct land take does not therefore have the potential to result in likely significant effects (LSE) and can be screened out and will not be considered further.

Forestry and woodland management - This threat / issue is of relevance to the habitats within the designated sites themselves. There is no pathway for woodland management at these locations to be affected by the proposals. There is no potential for forestry and woodland management to be impacted by the proposals, so they have been screened out and will not be considered further.

Habitat connectivity and availability for foraging and commuting

Barbastelle bats (functionally linked land) – Barbastelle bats are qualifying features for both SACs, and threats and issues relating to this species in the wider area have been identified in the relevant SIPs as:

- Off-site habitat availability / management;
- Habitat fragmentation / Habitat connectivity for barbastelle bats;
- Changes in land management, with reference to foraging and commuting routes.

The proposed development is within the 12km wider conservation area of The Mens SAC as set out in the Sussex Bat SAC planning and landscape scale enhancement protocol. It is therefore possible that bats from The Mens SAC use habitat within the site for foraging and/or commuting and all impacts need to be assessed.

As there is potential for habitat fragmentation from lighting or loss of functionally linked land for Barbastelle bats as part of the proposal and therefore, this has been screened in and will need to be considered further at Stage 2 Appropriate Assessment.

The proposed development is also within the 12km wider conservation area of Ebernoe Common SAC as set out in the Sussex Bat SAC planning and landscape scale enhancement protocol. Therefore, Bechstein's bats are considered likely to be absent, and as such, screened out, and they will not be considered further.

Invasive species

This threat concerns invasive rhododendron within The Mens SAC, and, as such there is no pathway for impacts due to the proposals. There is no potential for invasive species contained within in the proposals which would impact upon The Mens SAC, so they have been screened out and will not be considered further.

Hydrological changes

This threat / issue is of no relevance to The Mens SAC and Ebernoe Common SAC.

	The nearest area which would be affected by hydrological changes is the Arun Valley SAC/ SPA/ Ramsar site. Therefore, there is a predicted likely Significant Effects due to hydrological changes in combination with other plans and projects, so these have been <u>screened in</u>. This is considered under a separate HRA Appropriate Assessment for water neutrality. Air pollution The proposal will result in an increase in local residents and use of the SACs and Arun Valley SPA, and Ramsar are currently above their critical load for nitrogen deposition as noted in the HRA Screening Statement for Petworth Neighbourhood Development Plan (South Downs National Park Authority, 2017). Natural England Advice to Local Authorities when Considering Air Quality Impacts at HRA poses that air pollution impacts are predominately considered within 200m of a road. As the development is >200m from any Habitats site, the potential for LSE on the Habitats sites due to air pollution can be <u>screened out</u> and will not be considered further. Public access / disturbance, with regards to light levels. The HRA Screening Statement for Petworth Neighbourhood Development Plan (South Downs National Park Authority, 2017) notes that most visits to the Mens and Ebernoe Common SACs take place during daylight, with low levels of recreation at night. As such, they conclude that significant adverse effects due to lighting are unlikely. Recreation itself (i.e. during daylight hours) is not listed as threat within the SIPs. There is no potential for disturbance effects on Barbastelle bats associated with increased lighting from the development. This impact pathway therefore needs to be <u>screened out</u>. We believe that there will therefore be no Likely Significant Effect on the Sussex bat SACs from the development alone. In combination effects As there is potential for LSE from habitat connectivity for commuting bats, the potential for the development proposals to contribute to any likely significant effects, in combination with other plans and projects will be assessed at Stage 2 Appropriate Assessment.
Test 1 the significant test:	The Preliminary Ecological Appraisal (Arun Ecology Ltd., May 2026) recommends the implementation of bat sensitive lighting. External lighting would result in the loss of foraging and commuting habitat from lighting introduced to the residential development. There is evidence to suggest that Barbastelle bats use these for linear foraging and commuting routes within the Impact Risk Zone of the SACs. The LPA therefore considers that, without mitigation, it is not possible to conclude no 'likely significant effect' (LSE) to The Mens SAC in terms of Habitat connectivity and availability for foraging and commuting Barbastelle bats when considered from the development alone. In addition, the removal of four trees with the potential effect of changes in habitat connectivity in-combination with other plans and projects is also a possible pathway for LSE so this will be assessed further in Stage 2: Appropriate Assessment. Therefore, there is a need for this assessment to proceed to HRA Stage 2: Appropriate Assessment for impacts on designated features (Barbastelle bats). Therefore, in accordance with the Sussex Bat SAC planning and landscape scale enhancement protocol, this assessment needs to proceed to HRA

	Stage 2: Appropriate Assessment. This will consider, with mitigation, the impacts of fragmentation of commuting routes for Barbastelle bats on the above designated sites, either alone or in combination with other plans and projects. After mitigation has been embedded into the project design, Test 2 – the integrity test then needs to be applied.
Stage 2 Appropriate Assessment	
The above Stage 1 HRA screening has determined that LSE are possible at The Men's SAC as a result of impacts on habitat connectivity and availability for foraging and commuting Barbastelle bats. These pathways have been screened in, and the potential for adverse effects on site integrity, either alone, or in-combination will be assessed. Therefore, this section of the report to inform HRA Stage 2 only discusses the potential for impacts to commuting and foraging Barbastelle as a result of the proposed development. Changes in water quantity is assessed in a separate Water Neutrality Appropriate Assessment.	
Potential for Adverse Effects on the Integrity (AEOI) of a Habitats site from the development alone.	Barbastelle may commute along the treelines and hedgerows onsite so the site is considered important for Barbastelle bats at a site level which lies within the bat sustenance zone of a bat SAC designated for this Annex II species. Based on published data¹ Natural England recommends that the Impact Risk Zone of 12.0km (as detailed on Defra's MAGIC map) is used for the wider conservation area for the Sussex Bat SACs and significant impacts or severance to flightlines must be considered. This development is within the "wider conservation zone" for The Mens SAC, and therefore lies within a 'bat sustenance zone' for Barbastelle bats, a designated feature of The Men's SAC. Ebernoe Common SAC also has Barbastelle and Bechstein's bats as designated features. This development lies within the 12km wider conservation area for Ebernoe Common SAC, and therefore lies within a 'bat sustenance zone' as well.
Potential for Adverse Effects on the Integrity (AEOI) of a Habitats site from the development in combination with other plans and projects.	Based on the scale of the proposed development, and the conclusions of the HDC Local Plan HRA, any further search using data from surrounding LPA planning portals for other projects was not considered necessary. Horsham District Planning Framework (HDPF, 2015), Section 9.34 within Policy 31 states: In the case of The Men's SAC, development must not impact on bat flight paths in the district. As recommended in the Council's Habitat Regulations Assessment of this plan, a 'bat sustenance zone' has been identified and is shown on the Policies Map (see Appendix B). Within this area, it may be necessary for compensatory measures such as hedgerow enhancement to be undertaken prior to any development. The HRA for the Chichester Local Plan (final version, URS, 2014), considers disturbance of bat flight lines from both The Men's and Ebernoe Common SACs. With regards to The Men's, they conclude that <i>'it is unlikely that development (in the Chichester Local Plan) would lead to a likely significant effect on The Men's SAC'</i>. Other developments nearby over the past 5 years have comprised of smaller developments such as DC/24/0256 Change of use to two static caravans, Parsons Field, Pulborough, DC/23/1865, Erection of a new car dealership, Harwoods Garages, Pulborough and DC/24/1433 External building alterations, Goffisland Farm, West Chiltington. Larger developments have

	included DC/24/0069 erection of 20 dwellings, Land at Ryecrofts, Storrington and DC/21/0749 Reserved matters application for the erection of up to 62 residential units following approval of outline application DC/19/2015 on Land North of Downsview Avenue Storrington RH20 4LU. Other developments within the wider conservation zone for The Mens SAC include the HRA Appropriate Assessment (Place Services, May 2020) for Land at Lyons Farm Lyons Road Slinfold (DC/19/1723) for an outline application for the erection of a continuing care retirement community, concluded with mitigation secured, no adverse effect on site integrity of The Mens SAC either alone or in combination with other plans and projects and Natural England agreed with this decision. This was refused consent and a decision of appeal APP/Z3825/W/20/3265874 is still awaited as the Hearing is in progress. The HRA Appropriate Assessment (Place Services, June 2020) for Land at Wellcross Farm Broadbridge Heath (DC/19/1897) which was allowed at appeal (APP/Z3825/W/20/3262938) also for an outline application for the erection of a continuing care retirement community, concluded with mitigation secured, no adverse effect on site integrity of The Mens SAC or Ebernoe Common either alone or in combination with other plans and projects and Natural England agreed with this decision. The HRA Appropriate Assessment (Place Services, Feb 2021) for Land at Duckmoor East of Billingshurst (DC/20/2607) for an Outline Application for the development of 83 residential units, landscaping, access, parking and associated infrastructure on land at Duckmoor, East Billingshurst concluded that with mitigation secured the project will avoid an Adverse Effect on the Integrity of the Habitats sites listed in this assessment, either alone or in combination with other plan and projects. The application was refused consent but allowed at appeal (APP/Z3825/W/21/3283823). Natural England has confirmed that it has no objection to the development, providing all relevant mitigation is secured in any planning permission which the Inspector has included in the decision notice. Additional HRA Appropriate Assessment for development in the locality which have been deemed to have, with mitigation secured, no adverse effect on site integrity of The Mens SAC or Ebernoe Common either alone or in combination with other plans and projects include: DC/22/0141 (Cattlestone Farm, Pulborough), SDNP/20/05831/FUL (Pulborough Garden Centre), DC/21/2530 (Land South of East Street Billingshurst), DC/20/2567 (Billhook Farm West, Billingshurst), DC/19/02952 (Land at Platts Roundabout, Billingshurst) and DC/22/0141 (Cattlestone Farm, West Chiltington). Other developments nearby over the past 7 years have comprised of smaller developments such as extensions and building conversions. No in - combination effects are therefore considered likely to result from the on-site proposals and these small-scale developments. Any development proposals in the wider area around Pulborough will need to be assessed within the Horsham Local Plan HRA Appropriate Assessment or bespoke assessments at application stage. Given the above, and once the mitigation and compensation measures have been incorporated and secured, there is no potential for significant impacts from the proposals, it is considered that there is no potential for the development proposals to contribute to any adverse effects on integrity, in combination with other plans and projects.
Proposed mitigation for the project to secure the	Summary of mitigation package: • The planting of six native trees in compensation for the four trees already removed. This will be secured by a condition of any consent.

mitigation as a condition of any consent	• New native hedgerow will be planted on the northern boundary using Hawthorn, Blackthorn, Spindle and Wayfaring tree. • Reinforcement planting to the southern boundary hedgerow with Hawthorn, Blackthorn, Spindle and Wayfaring tree. • In order to minimise the effects of artificial lighting on foraging and commuting bats, the new residential development will incorporate a 'sensitive lighting plan', prepared as part of the detailed design in accordance with the guidelines set out by the Bat Conservation Trust. This will be secured by a condition of any consent. This measure is considered appropriate to avoid adverse effects on the integrity of the interest features (Barbastelle bats) of The Mens SAC. These will be secured by a condition of any consent.
Test 2 – the integrity test	Conclusion: Having considered the proposed avoidance and mitigation measures above, Horsham District Council concludes that, the project will avoid an Adverse Effect on the Integrity of The Mens SAC or Ebernoe Common SAC, either alone or in combination with other plan and projects. As the mitigation has been considered after HRA screening, this HRA Appropriate Assessment is in line with the People over Wind CJEU Court ruling. Having made this appropriate assessment of the implications of the plan or project for the sites in view of the Sussex bat SACs' conservation objectives and having consulted Natural England and fully considered any representation received where necessary, the authority must now consider its separate water neutrality Appropriate Assessment before it can agree to the plan or project under regulation 63 of the Conservation of Habitats and Species Regulations 2017 (as amended).

Summary

We have reviewed the Preliminary Ecological Appraisal (Arun Ecology Ltd., May 2026), relating to the likely impacts of development on designated sites, protected and Priority

species and habitats and the identification of proportionate mitigation. Please note that comments on Biodiversity Net Gain are provided by Horsham District Council in-house.

We note from the Preliminary Ecological Appraisal (Arun Ecology Ltd., May 2026) that there are no buildings on site and that an estimated number of four trees on site which may have had Potential Roost Features for bats had been removed prior to the survey. We therefore agree that no further surveys for bats are required.

The site lies approximately 6.8km northeast of The Mens Special Area of Conservation (SAC) and approximately 12.0km east of Ebernoe Common SAC ([MAGIC maps](#)). The site is therefore within the 12km Wider Conservation Area for both of these SACs, within which significant impacts or severance to flightlines must be considered. This is because the Wider Conservation Area is the full extent of the range of foraging areas required by Barbastelle bats, which are the qualifying feature of the SAC. However, there are no records for this species within 2km of the site (Sussex Biodiversity Record Centre (SxBRC) – accessed under licence). There are approximately 20 records of bats within 2km of the site, including Brown Long-eared Bat, Common Pipistrelle and Natterers bat (SxBRC). One European Protected Species Mitigation Licence has been granted within 2km of the site, at 1.6km to the east for Brown Long-eared and Common Pipistrelle bat 2015 ([MAGIC maps](#)). The site also lies approximately 10.1km northeast of Arun Valley SAC, SPA and Ramsar site. We agree that a minimum of six native trees should be planted to compensate for the loss of four trees which were removed prior to the survey.

We understand from the submitted documents that the site comprises lowland mixed deciduous woodland, modified grassland, sparsely vegetated urban land and developed land, sealed surface. The habitat connects to ancient and deciduous woodland in the wider landscape. There is a 10m long native hedgerow comprising Ash, Hazel, Bramble and Ivy on the southwestern boundary.

It is recommended in the Preliminary Ecological Appraisal (Arun Ecology Ltd., May 2026) that a sensitive lighting scheme is implemented for this application to mitigate against the increase in light measures following Bat Conservation Trust advice and The Institution of Lighting Professionals.

As there is a potential for habitat fragmentation from light spill of potentially functionally linked land for Barbastelle bats and compensatory planting will be required for the four trees which have already been removed, this has been screened in and will need to be considered at Stage 2 Appropriate Assessment of the LPA's project level Habitats Regulations Assessment (HRA).

As Barbastelle bat may use the onsite habitat, we support the recommendation that a Wildlife Friendly Lighting Strategy is implemented for this application (Preliminary Ecological

Appraisal (Arun Ecology Ltd., May 2026)) to avoid impacts from lighting disturbance. This should be secured by a condition of any consent and implemented in full. Therefore, technical specification should be submitted prior to occupation, which demonstrates measures to avoid lighting impacts to foraging / commuting bats, which are likely to be present within the local area. This should summarise the following measures recommended by [Guidance Note:08/23 \(Institute of Lighting Professionals\)](#) will be implemented:

- Do not provide excessive lighting. Light levels should be as low as possible as required to fulfil the lighting need.
- All luminaires should lack UV elements when manufactured. Metal halide, compact fluorescent sources should not be used.
- Warm White lights should be used at <2700k. This is necessary as lighting which emits an ultraviolet component or that has a blue spectral content has a high attraction effect on insects. This may lead in a reduction in prey availability for some light sensitive bat species.
- Where appropriate, external security lighting should be set on motion-sensors and set to as short a possible a timer as the risk assessment will allow.
- Luminaires should always be mounted horizontally, with no light output above 90° and/or no upward tilt.
- Only if all other options have been explored, accessories such as baffles, hoods or louvres can be used to reduce light spill and direct it only to where it is needed. However, due to the lensing and fine cut-off control of the beam inherent in modern LED luminaires, the effect of cowls and baffles is often far less than anticipated and so should not be relied upon solely.

We therefore believe that, with mitigation, there will be no Adverse Effect on Integrity of the SAC. We advise the LPA to prepare a project level HRA Appropriate Assessment to record its decision and consult Natural England on the conclusion.

We support the Precautionary Method Statement for reptiles in Sections 6.5.8 of the Preliminary Ecological Appraisal (Arun Ecology Ltd., May 2026). This should be secured by a condition of any consent and implemented in full.

We also support the Precautionary Method Statement for mobile protected and Priority species (including Hedgehog, which is a Priority and threatened species) in Sections 6.5.1, 6.5.2 and 6.5.7 of the Preliminary Ecological Appraisal (Arun Ecology Ltd., May 2026). This should be secured by a condition of any consent and implemented in full.

We are satisfied that there is sufficient ecological information available for determination of this application. We have no objections on ecological matters excluding Great Crested Newt as we have been instructed to leave comments on this European Protected Species to the [NatureSpace Partnership](#).

This provides certainty for the LPA of the likely impacts on designated sites, protected and Priority species & habitats and, with appropriate mitigation measures secured, the development can be made acceptable.

The mitigation measures identified in the Preliminary Ecological Appraisal (Arun Ecology Ltd., May 2026) should be secured by a condition of any consent and implemented in full. This is necessary to conserve and enhance protected and Priority species particularly those recorded in the locality, including bats, reptiles and mobile protected and Priority species.

We also support the proposed reasonable biodiversity enhancements for protected, Priority and threatened species, which have been recommended in the Preliminary Ecological Appraisal (Arun Ecology Ltd., May 2026) to secure net gains for biodiversity, as outlined in the National Planning Policy Framework (August 2026) N2 Part F. This should be secured by a condition of any consent and implemented in full.

This will enable LPA to demonstrate its compliance with its statutory duties including its biodiversity duty under s40 NERC Act 2006 (as amended) and delivery of mandatory Biodiversity Net Gain.

Impacts will be minimised such that the proposal is acceptable subject to the conditions below based on BS42020:2013. We recommend that submission for approval and implementation of the details below should be a condition of any planning consent:

Recommended conditions

1. ACTION REQUIRED IN ACCORDANCE WITH ECOLOGICAL APPRAISAL RECOMMENDATIONS

“All mitigation measures and/or works shall be carried out in accordance with the details contained in the Preliminary Ecological Appraisal (Arun Ecology Ltd., May 2026), as already submitted with the planning application and agreed in principle with the local planning authority prior to determination. This includes the Precautionary Method Statement for reptiles in Section 6.5.8 and the Precautionary Method Statement for mobile protected and Priority species in Sections 6.5.1, 6.5.2 and 6.5.7 of the Preliminary Ecological Appraisal (Arun Ecology Ltd., May 2026). This avoids impacts on protected species.

This may include the appointment of an appropriately competent person e.g. an ecological clerk of works (ECoW) to provide on-site ecological expertise during construction. The appointed person shall undertake all activities, and works shall be carried out, in accordance with the approved details.”

Reason: To conserve protected and Priority species and allow the LPA to discharge its duties under the Conservation of Habitats and Species Regulations

2017 (as amended), the Wildlife & Countryside Act 1981 (as amended) and s40 of the NERC Act 2006 (as amended).

2. PRIOR TO ANY WORKS ABOVE SLAB LEVEL: BIODIVERSITY COMPENSATION AND ENHANCEMENT STRATEGY

“A Biodiversity Compensation and Enhancement Strategy for protected and Priority or threatened species, including the compensatory planting of six native trees, prepared by a suitably qualified ecologist in line with the recommendations of the Preliminary Ecological Appraisal (Arun Ecology Ltd., May 2026), shall be submitted to and approved in writing by the local planning authority.

The content of the Biodiversity Compensation and Enhancement Strategy shall include the following:

- a) Purpose and conservation objectives for the proposed compensation and enhancement measures;*
- b) detailed designs or product descriptions to achieve stated objectives;*
- c) locations, orientations and heights of proposed compensation and enhancement measures by appropriate maps and plans (where relevant);*
- d) persons responsible for implementing the compensation and enhancement measures; and*
- e) details of initial aftercare and long-term maintenance (where relevant).*

The works shall be implemented in accordance with the approved details shall be retained in that manner thereafter.”

Reason: To enhance protected and Priority species & habitats and allow the LPA to discharge its duties under NPPF (August 2026) N2 Part F.

3. PRIOR TO OCCUPATION: WILDLIFE SENSITIVE LIGHTING DESIGN SCHEME

“Prior to occupation, a “lighting design strategy for biodiversity in accordance with Guidance Note 08/23 (Institute of Lighting Professionals) shall be submitted to and approved in writing by the local planning authority. The strategy shall:

- a) identify those areas/features on site that are particularly sensitive for bats and that are likely to cause disturbance in or around their breeding sites and resting places or along important routes used to access key areas of their territory, for example, for foraging; and*
- b) show how and where external lighting will be installed so that it can be clearly demonstrated that areas to be lit will not disturb or prevent the above species using their territory or having access to their breeding sites and resting places.*

All external lighting shall be installed in accordance with the specifications and locations set out in the scheme and maintained thereafter in accordance with the scheme. Under no circumstances should any other external lighting be installed without prior consent from the local planning authority."

Reason: To allow the LPA to discharge its duties under the Conservation of Habitats and Species Regulations 2017 (as amended), the Wildlife & Countryside Act 1981 (as amended) and s40 of the NERC Act 2006 (as amended).
