

The requested works follow the site survey recommendations, which state.

''Large groups of Spindle Shank fungi around the tree's base on its west side. Change in resonance on the inside west buttress. Probed to 220mm. The remaining buttresses were tested with no change in resonance.''

After reducing the height by 2.5m, this would be leaving a residual height of 8.5m.
After reducing the sides by up to 3m, this would be leaving a residual width of 4m on North, 4m on East, 4m on South and 4m on West.
